Abstract

39 The tuna supply chain faces critical challenges regarding traceability, transparency
40 and sustainability, particularly due to certain issues such as illegal, unreported and
41 unregulated (IUU) fishing. Ensuring the traceability within the tuna supply chain
42 is a critical role in enhancing consumer confidence, transparency and promoting
43 adherence to environmental and legal standards. This research explores the appli-
44 cation of blockchain technology as a solution to these given issues. By combining
45 qualitative insights gathered from different key stakeholders across the supply
46 chain, the researchers evaluated the potential of blockchain to improve product
47 traceability, accountability, and trust. The findings suggests that blockchain offers
48 a secure and transparent method of recording the journey of tuna products from
49 catch to market, helping to combat IUU fishing and promote sustainable practices.
50 However, successful implementation requires overcoming barriers related to tech-
51 nological integration, cost, and stakeholder collaboration. This study provides
52 valuable insights into the feasibility and impact of blockchain adoption within
53 other fish supply chains, contributing to the development of more transparent,
54 responsible, and sustainable tuna industries.

¹⁶⁵ Chapter 1

¹⁶⁶ Introduction

¹⁶⁷ 1.1 Overview

¹⁶⁸ The tuna supply chain faces critical issues that affect both the industry and its
¹⁶⁹ consumers. Illegal fishing, overfishing, and poor traceability threaten the sustain-
¹⁷⁰ ability and ethical trade. A lack of transparency compromises product quality
¹⁷¹ and misleads consumers. Blockchain technology can address these challenges by
¹⁷² tracking the tuna's journey from ocean to plate through a secure, tamper-proof
¹⁷³ ledger. This system also holds stakeholders to comply to legal standards.

¹⁷⁴ Although blockchain integration in the tuna sector is underway, gaps remain in its
¹⁷⁵ implementation. This study helps to address the industry's need for transparent
¹⁷⁶ and secure tracking of tuna products from ocean to consumer, while assessing the
¹⁷⁷ feasibility of implementing blockchain at scale in the seafood sector.

¹⁷⁸ 1.2 Problem Statement

¹⁷⁹ Fish is one of the most consumed protein products in the Philippines. Before the
¹⁸⁰ COVID-19 pandemic, fish was the most consumed animal protein in the Philip-
¹⁸¹ pines with annual per capita consumption of 40 kg (Agriculture and Agri-Food
¹⁸² Canada, 2022). Among the wide variety of fish, tuna stands out as a particularly
¹⁸³ significant commodity due to its high demand and economic value. Although the
¹⁸⁴ nation is gifted with an abundance of aquatic resources, the methods of dispersal
¹⁸⁵ of the product usually leads to inefficiency in terms of sales, pricing, and overall
¹⁸⁶ product quality for the consumers. The problem arises with the introduction of
¹⁸⁷ a supply chain from several middlemen between the fish farmer or producer and
¹⁸⁸ wholesaler in the coastal and aquatic regions towards the consumers with less
¹⁸⁹ access to fresh fish. Consequently, both consumers and suppliers face challenges
¹⁹⁰ in ensuring transparent and fair pricing, product tracking, and maintaining the
¹⁹¹ quality of fish products.

¹⁹² 1.3 Research Objectives

¹⁹³ 1.3.1 General Objective

¹⁹⁴ The general objective of the study is to design and develop a blockchain-driven
¹⁹⁵ application that improves the traceability of the tuna supply chain. Given the
¹⁹⁶ timely issues regarding illegal, unreported and unregulated (IUU) fishing and lack
¹⁹⁷ of product traceability and transparency, this study addresses these challenges
¹⁹⁸ through an application that has the capability to provide an immutable ledger

¹⁹⁹ and tamper-proof records. The result of this study serves as a framework for
²⁰⁰ integrating blockchain technology in the fish supply chain, specifically for tuna.
²⁰¹ This also supports future researchers and developers facing similar challenges in
²⁰² the industry.

²⁰³ 1.3.2 Specific Objectives

²⁰⁴ To further specify the research objectives, the study focuses to:

²⁰⁵ 1. develop a smart contract framework using blockchain technology for data
²⁰⁶ verification and transaction recording, ensuring secure and tamper-proof
²⁰⁷ data for the stakeholders,

²⁰⁸ 2. design and develop a blockchain-driven application with a user-friendly in-
²⁰⁹ terface that allows stakeholders to access and input data while enhancing
²¹⁰ traceability in the tuna supply chain through a tuna asset record for the
²¹¹ supply chain participants, and

²¹² 3. deploy the application after completing all necessary preparations for soft-
²¹³ ware development and to evaluate its overall results and effectiveness in en-
²¹⁴ hancing the tuna supply chain, as discussed in the fourth and fifth chapters
²¹⁵ of the study.

216 1.4 Scope and Limitations of the Research

217 The scope of this study focuses on how blockchain technology can be applied to
218 enhance traceability and transparency within the tuna supply chain. It involves
219 features such as smart contracts for recording the transactions and user interface
220 for stakeholders. The study also focuses exclusively on whole, small-sized caught
221 tuna products in the supply chain, excluding processed forms such as canned
222 or packaged tuna. The research examines the traceability of whole tuna from
223 capture to market sale, specifically centering on a supplier based in Miagao and
224 San Joaquin, Iloilo.

225 This study focuses solely on the supply chain in within the specified municipalities
226 of Iloilo, so findings may not fully represent global practices. As it concentrates
227 on blockchain's role in traceability, other potential functions of the technology fall
228 outside of the scope of this research.

229 1.5 Significance of the Research

230 This study serves a significant purpose for several stakeholders in the tuna supply
231 chain. This study aims to solve the problems related to the management of tuna
232 supply chain, particularly with regards to product traceability.

233 • The Stakeholders

234 – This study enhances transparency and accountability, allowing stake-
235 holders such as fishers, suppliers, and retailers to access tamper-proof

236 and accurate information, thereby promoting a more ethical and au-
237 thentic supply chain. By providing a digital record of the product's
238 history, this study helps ensure compliance with environmental and
239 legal standards. In cases of anomalies such as oil spills, red tide oc-
240 currences, and illegal fishing activities, stakeholders can be involved
241 in identifying and addressing these issues, fostering a collaborative ap-
242 proach to sustainability. Similarly, the record of a tuna asset can be
243 utilized for accountability purposes when problems such as damaged
244 products, mislabeling, or contamination arise, allowing stakeholders to
245 trace and resolve them efficiently.

246 • The Consumers

247 – This study helps consumers verify the history of the tuna product from
248 its origin up until its journey to the consumers, therefore increasing
249 trust and transparency. By promoting traceability, it offers a more de-
250 tailed and verifiable record of the supply chain, enabling consumers to
251 assess sustainability practices and identify stakeholders responsible for
252 any potential issues affecting the tuna product. This, in turn, encour-
253 ages critical evaluation of the tuna supply chain, driving improvements
254 in accountability, resource management, and ethical sourcing.

255 • For Future Researchers

256 – As blockchain technology continues to grow, this study contributes to
257 the application of blockchain in the supply chain management and the
258 insights regarding its benefits and limitations. This research can be

259 helpful in the growing knowledge on digital solutions for traceability
260 and transparency for future research.

261 • The Policy Makers

262 – This study provides policy makers a reliable and data-driven founda-
263 tion in monitoring and regulating the tuna supply chain. By lever-
264 aging tamper-proof and transparent records, policymakers can more
265 effectively enforce compliance with fishing quotas and environmental
266 protections. This research also aids in lessening the illegal, unreported
267 and unregulated (IUU) fishing practices, contributing to the national
268 sustainability goals.

²⁶⁹ Chapter 2

²⁷⁰ Review of Related Literature

²⁷¹ This chapter discusses the features, capabilities, and limitations of existing re-
²⁷² search, algorithms, or software that are related/similar to the Special Problem.

²⁷³ The reviewed works and software must be arranged either in chronological order,
²⁷⁴ or by area (from general to specific). Observe a consistent format when presenting
²⁷⁵ each of the reviewed works. This must be selected in consultation with the adviser.

²⁷⁶ In purchasing goods, one thing to consider is the quality of it. An important part
²⁷⁷ of determining the quality is to know the traceability of the supply chain. Trace-
²⁷⁸ ability refers to the ability of tracking the journey of the product from its source
²⁷⁹ until its destination. The term “traceability” is now more utilized in both the
²⁸⁰ food and production industry (Islam & Cullen, 2021). In the context of the tuna
²⁸¹ supply chain, it can be used not only to promote transparency to consumers but to
²⁸² also ensure compliance with environmental and legal standards. With blockchain
²⁸³ technology, the status of tuna at each stage could be recorded in the blockchain

which could be used for traceability. This paper aims to address the following research question: *How can blockchain technology improve the traceability of the tuna supply chain management?*

2.1 State of Tuna Industry in the Philippines

In 2014, the Philippines became the top global producer of tuna according to Llanto, et. al. (2018) . The tuna is caught in domestic and international fishing grounds near the country through various fishing methods such as purse seines, gill nets, handline (hook and line) and ring net. Among the tuna species, the skipjack tuna accounted for the largest portion of the catch by 40%. The study of PCMARD (1993 as cited in Nepomuceno et al., 2020) stated that skipjack tuna are often caught out in open waters or in offshore areas. In addition, Nepomuceno et al. (2020) mentioned in their study that the dominant production of skipjack tuna, together with yellowfin tuna, was recorded in South Cotabato. The tuna supply has declined since 2000 due to various factors including overfishing, climate change, and the laws and regulations imposed by different governing bodies for the tuna fishing ground such as the Regulation No. 56, released by the Indonesian Maritime Affairs and Fisheries Ministry in November 2014. The regulation imposed a moratorium on issuance of fishing licenses from 3 November 2014 to 30 April 2015 to eliminate illegal, unreported, and unregulated fishing in Indonesian waters near Mindanao where tuna are known to thrive (Llanto et al, 2018) . The regulation imposed for the protection of tuna fishing grounds in the western and central pacific ocean also lead to the decline of local tuna production which requires the fishing operators of the Philippines to invest in the manufacturing and

³⁰⁷ processing of fish particularly tuna in Indonesia which includes hiring Indonesian
³⁰⁸ crew to be deployed in the Philippine fishing vessels (Llanto et al, 2018) .

³⁰⁹ 2.2 Fishing Regulations in the Philippines

³¹⁰ A study of Asche et al. (2018) divided the fishing management strategies that
³¹¹ include right-based fishery management like territorial use of rights, access rights
³¹² and harvest rights. It discussed that a rights-based system could support the sus-
³¹³ tainability of global fisheries by taking in account the three pillars of sustainability
³¹⁴ (economic development, social development, and environmental protection) rather
³¹⁵ than focusing on their trade-offs. A restriction on the fisherman's behavior by har-
³¹⁶ vest rights and catch shares could be a profit problem for them in the short-run
³¹⁷ but in the long-run, this could help both in the fish stock and the fishermen's
³¹⁸ profit. Lack of restriction could lead to overfishing. Access rights limit the en-
³¹⁹ try to fishery through permits which can also reduce the effect of high harvest
³²⁰ levels. A sustainable fishing management system in the Philippines is important
³²¹ in order to preserve marine resources. To preserve these resources and protect
³²² the livelihood of local communities, various fishing management strategies should
³²³ be implemented. A collaboration between the fishermen, local government and
³²⁴ other stakeholders often happens to manage marine resources (Pomeroy & Court-
³²⁵ ney, 2018) . The study of Pomeroy and Courtney discussed that marine tenure
³²⁶ refers to the rights and responsibilities in terms of who can access the marine and
³²⁷ coastal resources. The 1998 Fisheries Code paved the way for local government
³²⁸ units (LGUs) to be involved in the management of municipal waters. LGUs are
³²⁹ given the responsibility to overlook and regulate fisheries and establish marine

330 tenure rights for fishers within 15 km from shore and these rights are applicable
331 for municipal fishers and their respective organizations that are listed in the reg-
332 istry (Pomeroy & Courtney, 2018) . In this way, it resolved problems in terms of
333 fishing rights between small-scale and commercial fishing.

334 According to the study conducted by Mullon et al. (2017) , the five major species
335 of tuna: yellowfin *Thunnus albacares*, bigeye *Thunnus obesus*, bluefin *Thunnus*
336 *thynnus* or *Thunus orientalis*, albacore *Thunnus alalunga*, and skipjack *Katsu-*
337 *wonus pelamis* are harvested to meet the global supply chain demand which causes
338 those group of tuna fishes to be heavily exploited and threatened. The study con-
339 ducted by Paillin et al. (2022) states that there are multiple risk agents in the
340 supply chain assessment of tuna, these include the lack of standard environmental
341 management system, lack of maintenance management, and lack of quality control
342 from suppliers. The usage of efficient boats and good quality catching technology
343 can also lead to fisheries depletion which causes various agency such as BFAR
344 (Bureau of Fisheries and Aquatic Resources), the local government units, and the
345 Philippine Coast Guard to enable policies for upholding closed fishing season to
346 restrict large scale fishing vessel to minimize the fishing activities in the iden-
347 tified areas (Macusi et al, 2023) . The implementation of closed fishing season
348 caused delay or lack of fish supply, which led to higher fish prices. The growing
349 demands and depleting population of tuna fishes coupled with the rapid increase
350 in fuel costs can have a negative impact on the future of the supply chain in tuna
351 fisheries (Mullon et al., 2017) . With factors concerning the slow decline of tuna
352 catches in the Philippines and surrounding nations, the future of the global supply
353 chain of tuna must be addressed.

354 2.3 Tuna and Fish Supply Chain

355 According to Macusi et al (2023) , the implementation of traceability programs in
356 the agricultural product commodities and value chain in the Philippines is slower
357 than its competing nation for tuna production. The Philippines has been steadily
358 responding to the market innovation and integration of cost-effective and smart
359 technologies for the traceability of various commodities. Accurate catch data is
360 crucial for determining the attributes of the fish health, size, volumes, and matu-
361 rity (Grantham et al, 2022) which can be used as a basis for the transparency of
362 the traceability of the fish product. Illegal, unreported, and unregulated (IUU)
363 is another concern for the fish industry. In the 2000s, the persistent IUU became
364 a global crisis affecting the biological, ecological, and socio-economics factors re-
365 volving around marine livelihood in Southeast Asia (Malinee et al, 2020) . IUU
366 fishing is known to cause short- and long-term problems in the socio-economic
367 opportunities which affects food security and results in the possible collapse of
368 the fish industry and stocks due to overfishing (Malinee et al, 2020) .

369 The establishment of marine protected areas in the Davao Gulf (MPAs) affected
370 the management of small-scale fisheries due to the growing population and de-
371 mands for seafood products. The closure of a wide range of fishing areas hosting
372 diverse and marine organisms has affected the socio-economics and livelihood of
373 the local and small-scale fishermen (Macusi et al, 2023) , this in turn resulted
374 in IUU fishing. To ensure that fish stocks in the gulf are sustainably managed,
375 the implementation of GPS for tracking the movement and activities of fishers
376 through logbook and habitat monitoring can provide data and insights for track-
377 ing, monitoring, and understanding the condition of the marine resources (Obura

³⁷⁸ et al, 2019; Macusi et al, 2023) .

³⁷⁹ 2.4 Tuna Supply Chain Stages and Roles

³⁸⁰ The study conducted by Delfino (2023) highlights the roles of different actors
³⁸¹ involved in the supply, production, distribution, and marketing of skipjack tuna
³⁸² in Lagonoy Gulf in the Philippines. The study showcased a total of eleven inter-
³⁸³ connected value chains but are generalized into four major stages or roles - fishers,
³⁸⁴ wholesalers, retailers, and processors. The fishers are the initial players responsible
³⁸⁵ for catching fish using boats or fishing vessels equipped with purse seines, gillnets,
³⁸⁶ and handlines(hook and line). Wholesalers are the actors for selling freshly caught
³⁸⁷ fish locally and regionally, they receive the fish supply directly from the fishers.
³⁸⁸ The next stage after wholesalers are the retailers, these intermediaries sell the fish
³⁸⁹ product to local markets, house-to-house (*libod*" in Visayan languages), and other
³⁹⁰ local medium such as *talipapa* or fish stands. Another intermediary is the proces-
³⁹¹ sors, they convert fresh skipjack tuna into products like smoked tuna. The given
³⁹² stages also overlapped in some cases as there are fisher-wholesalers who catch and
³⁹³ sell the fishes directly to retailers and there are also retailer-processors that both
³⁹⁴ sell whole and processed products. Despite having a firm system to transport fish
³⁹⁵ from sea to table, all the actors face problems during seasonal challenges involving
³⁹⁶ the availability of the tuna product. The fishers also need to consider strict local
³⁹⁷ regulations such as RA 10654 and RA 8550. The strict implementation of RA
³⁹⁸ 10654 and RA 8850 at the local level or the Fisheries Code of the Local Philip-
³⁹⁹ pines aims to curb the problem encountered during season of deficit tuna supply
⁴⁰⁰ by limiting fishing activities and implementation of 15-km boundary lines in the

401 municipal waters of each municipality (Delfino, 2023) . The study suggests that
402 improving conditions for value chain actors, particularly through support services
403 and government involvement could lead to a stable and sustainable exchange of
404 skipjack tuna and other seafood products from sea to table.

405 A study of Digal et al. (2017) discussed one of the value chains which was the
406 purse seine or the skipjack tuna value chain in the Philippines. Purse seining
407 is the method of catching a school of fish wherein it uses a large net around it,
408 trapping them and pulling the bottom of the net like a purse-like (Digal et al.,
409 2017) . This type of catching often targets dense fishes like tuna. Skipjack fishes
410 that weigh 300 grams and above are often sold to canneries, while the smaller ones
411 are sold at local markets, often used for consumption by Filipinos. Purse seiners
412 are usually employees of a fishing company and they have a fixed salary. They
413 could reach international waters so they need to bring their passports with them.
414 Jamboleros, who act as distributors, often buy from different fishing companies
415 per *banyera* or tub. They will then pack the fish and sell it to traders/truckers
416 who go to General Santos fishport. These traders will deliver it to the retailers
417 across Kidapawan who contacted them. There is no formal contract between the
418 jambolero and traders/truckers. One of the issues of the retailer is for everyday
419 that a fish is not sold, they would have a ₱10.00 less per kilogram.

420 2.5 Factors Affecting the Tuna Supply Chain

421 The tuna supply chain faced several factors and challenges for the safety and
422 quality of the product (Mercogliano & Santonicola, 2019) . Without the proper

423 handling of the tuna after catching it can lead to various food-borne diseases and
424 outbreaks. The most frequent and mitigated food-borne causing compound is
425 Histamine(HIS) which causes Scombrotoxin fish poisoning (SPF) outbreaks re-
426 lated to food allergies when consumed (EFSA, 2017; Peruzy et al., 2017). Tuna
427 species are known for having high presence of amino acid histidine concentrations
428 which are converted to HIS by bacterial enzyme histidine-decarboxylase or HDS
429 (Aponte et al., 2018; Verkhivker & Altman, 2018) . To combat the risk of SPF
430 and other food-borne diseases caused by tuna consumption, several safety hazards
431 and protocols were imposed to the tuna supply chain management. The term cold
432 chain refers to the storing of fish in temperatures less than 5°C after it was caught
433 (Yang & Lin, 2017). According to the article published by Mercogliano and San-
434 tonicola (2019), implementing a cold chain from the time the fish is caught until it
435 is consumed is crucial for mitigating the outbreak of HIS poisoning. Additionally,
436 the article also states that using high-quality raw tuna, cold chain maintenance,
437 pre-cooking, and cooking can also reduce HIS development.

438 According to the study conducted by Pacoma and Yap-Dejeto entitled "Health
439 Risk Assessment: Total Mercury in Canned Tuna and in Yellowfin and Frigate
440 Tuna Caught from Leyte Gulf and Philippine Sea", examines mercury contamina-
441 tion in both canned and locally caught tuna in the Philippines. Methylmercury,
442 a potent neurotoxin, presents risks especially to vulnerable groups like pregnant
443 women and children. The study reveals that canned tuna generally has higher
444 mercury levels (0.07 µg/g) than locally caught tuna (0.002–0.024 µg/g). Based
445 on the Food and Agriculture Organization's fish consumption data, the mercury
446 intake from locally caught tuna is within the World Health Organization's safe
447 limits, whereas canned tuna may exceed these limits for some groups. This high-

448 lights the need for monitoring of the mercury levels in the Philippine tuna supply
449 chain, as tuna is a dietary staple and economic asset in the region, to mitigate
450 health risks from chronic exposure.

451 Risk management is important for tuna supply chains to analyze the root of the
452 risk and to assess the probability of such cases through the information taken from
453 the different locations or sorting states where the tuna product is handled before
454 being purchased by the consumer or end-use state (Parenreng et al, 2016) .

455 2.6 Technology of Blockchain

456 According to Zheng et al. (2017) , the idea of blockchain was first introduced in
457 2008 and was first implemented in the Bitcoin business which deals with cryp-
458 tocurrencies. This kind of technology tracks transactions and stores it in a list of
459 blocks. According to Sarmah (2018) , it acts as a database of transactions which
460 is overseen and verified by distributed nodes. Blockchain works by linking blocks
461 (where data is stored). When a transaction is initiated, it is then broadcasted to
462 a network of computers that verifies the transaction and if the verification is suc-
463 cessful, it will then be grouped and linked with the previous transactions that will
464 be added to the blockchain (Zheng et al., 2017) . It does not require a middleman
465 because it operates on a peer-to-peer transaction. This eliminates the traditional
466 way of a central authority like the bank (Sarmah, 2018) .

467 Automated process of transactions is also one of the salient features of blockchain
468 which is executed automatically based on predefined rules involving no third par-
469 ties. These predefined rules are conditions that need to be met in order for the

transaction to proceed. Given this, blockchain is described to be a “trust-free technology” since it reduces the number of trusted individuals instead they trust the machine itself which is difficult to manipulate given its cryptographic security (Ali et al., 2023). Blockchain also ensures immutability with its data. Once the data has been added to the blockchain, it is difficult to change since each block has a cryptographic link to other blocks, which guarantees that the data is tamper-proof and permanent (Ali et al., 2023). This also brings back to the essence of blockchain being trustworthy. Immutability and tamper-proof enhances data management. It also helps prevent fraudulent activities especially with finances. Transparency with transactions is one of the features of blockchain which makes the chances of data being tampered less because it is accessible to anyone on the network (Ali et al., 2023).

According to Nasurudeen Ahamed et al. (2020) , Blockchain technologies are classified into 3 types: Public Blockchain, Private Blockchain,. Consortium Blockchain. In Public Blockchain, all public peers can join together and have equal rights (for example, read, write, and execute) on the public node. In Private Blockchain, only Authorized Private Peers have access to the network. The access to the node in the private peer is limited to the specific node. In Consortium Blockchain, only the authorized team can access and join this blockchain, and all operations in the node must adhere to the access. Their paper, Sea Food Supply Chain Management Using Blockchain, gave the idea that with the purpose of creating a blockchain-driven application, a public blockchain approach could be appropriate for handling consumer-based information as users can verify non-sensitive data like prices, freshness and availability. While handling sensitive information such as internal works and logistics, a consortium blockchain where authorized users

2.7. OPPORTUNITIES OF BLOCKCHAIN TECHNOLOGY FOR SUPPLY CHAIN MANAGEMENT

495 such as fish owners, distributors, manufacturers, etc. can handle the core supply
496 chain operations, like tracking the movement of tuna from catch to market.

497 2.7 Opportunities of Blockchain Technology for 498 Supply Chain Management

499 Supply chain is the term used for understanding the business activities for design-
500 ing, developing, delivering, purchasing, and using a product or service (Hugos,
501 2024) . Companies and various industries are heavily relying on supply chains to
502 achieve their business objectives. The purpose of supply chain began to be more
503 significant in the last century as firms discovered that supply chain can be used for
504 competitive advantage instead of just a cost driver as believed in the bygone days
505 (Snyder & Shen, 2019) . Following the supply chain paradigm can demonstrate
506 the delivery of a product or service while strongly emphasizing the customer's
507 specifications. With the increasing studies conducted and published for supply
508 chain, many companies adopted this practice for the benefit of their longevity,
509 as such the term supply chain management has come into place. The Council of
510 Supply Management Professionals or CSCMP (2024) defines supply chain man-
511 agement as the planning and management of all activities involved in sourcing
512 and procurement, conversion, and all logistics management activities; essentially,
513 supply chain management integrates supply and demand management within and
514 across the company. Supply chain management is also involved with the relation-
515 ship with collaborators and channel partners such as suppliers, intermediaries,
516 third party providers, and customers (CSCMP, 2024) .

517 In the article of Cordova et. al (Cordova et. al, 2021) , the role of supply chain
518 management and the growing opportunities for blockchain technology in supply
519 chain management was discussed. According to Cordova (2021) , the recent in-
520 novation and globalization has given rise to the idea of using a data innovation
521 framework for supply chain management. Technologies such as blockchains and
522 enterprise resource planning (ERP) are among the highly contested platforms for
523 supply chain management to operate in a seamless interaction and distribution
524 with the product while heavily relying on modern technology and innovations.
525 The logistic business of the supply chain market is wide and complex, the distri-
526 bution and flow of products is not a simple job, and it heavily relies on paperwork
527 (Georgiou, 2019; Cordova et. al, 2021) . The usage of paperwork for logistic
528 business can be at higher risk for lack of transparency, complex or unreliable
529 tracking, deficiency of information, and possible dispute due to the tendency of
530 paper to disappear or tear down, this can in turn delay the process and delivery
531 of the item/product. With the issues encountered in the supply chain market,
532 businesses, people and enterprises are eyeing toward the application of blockchain
533 technology on supply chain management (Cordova et. al, 2021) .

534 Implementing blockchain innovation in ERP systems and companies that use dig-
535 ital platforms can provide opportunities and contribute greatly for business pro-
536 cesses (EOS Costa Rica, 2019 as cited by Cordova et al, 2021) . The ability of
537 blockchain technology to append new transactions to an existing block containing
538 data can be thought of as a decentralized ledger (Cole et al, 2019) . The method
539 of blockchain to behave like a decentralized ledger can serve as a single unified
540 source of data which in turns create a clear and consistent audit trail involved
541 in the manufacturing, assembly, supply, and maintenance processes. According

2.8. SUPPLY CHAIN MODEL WITH BLOCKCHAIN TECHNOLOGY OF FISHING INDUSTRY

542 to Cole et al (2019) , blockchains provide data to the movement and relation
543 of products from its origin, inventory, shipment, and purchase. One potential of
544 blockchain for supply chain management (Hackius & Petersen, 2017) is the ease of
545 paperwork processing, specifically in ocean freight. When IBM and Maersk settled
546 for a permissioned blockchain solution, they were able to connect a global network
547 of shippers, carriers, ports, and customs. Another potential of blockchain in SCM
548 is to identify counterfeit products. In the pharmaceutical industry and healthcare
549 setting, blockchain could improve patient safety and hazard through establishing
550 supply chain transparency from manufacturers through wholesale and pharmacies
551 to the individual patients (Hackius & Petersen, 2017) . Using blockchain can
552 make it harder to tamper or alter the products chain of origin with illegal and
553 counterfeit products. Blockchain have the potential to facilitate origin tracking.
554 According to Cordova et al (2021) , blockchain allows organizations to input rel-
555 evant data inside a chain which would have constant updates and tracking, this
556 supports visibility and traceability of the origin of the product. Smart contracts,
557 an executable code and a feature of blockchain, serves as a computer protocol
558 made between participants to digitally facilitate, execute, verify, and enforce an
559 agreement or terms of contract which is then stored in the blockchain (Khan et
560 al, 2021) .

561 **2.8 Supply Chain Model with Blockchain Tech-**

562 **nology of Fishing Industry in Indonesia**

563 Larissa and Parung (2021) who explored the application of blockchain and de-
564 signed a supply chain model based on it, specifically for the Indonesian fishing
565 industry, aimed to mitigate the challenges in the fishery industry such as product
566 quality (perishability), long shipping times ,and data manipulation. The model
567 they developed of using QR codes for each player in the supply chain then tracking
568 it by scanning the QR code, could inspire our approach in building a blockchain-
569 driven application for the tuna supply chain in the Philippines.

570 **2.9 Existing Technology Intended for Traceabil-**

571 **ity and Supply Chain**

572 A study of Shamsuzzoha et al. (2023) discussed the feasibility of implementing a
573 blockchain driven application called ‘Tracey’ for monitoring the fish traceability
574 in supply chain management. The study utilized the theoretical framework devel-
575 oped by Islam & Cullen (2021) for improving the understanding and effectiveness
576 of implementing a food traceability system. The framework consists of four prin-
577 ciples as a basis for the supply chain management: identification, data recording,
578 data integration, and accessibility (Islam & Cullen, 2021) . The Tracey applica-
579 tion utilized a public-private hybrid blockchain-based conceptual framework by
580 Mantravadi and Srai (2023) to uphold the transparency, traceability, and certifi-
581 cation of the sea food produce, specifically shrimp. The prototype being studied

2.9. EXISTING TECHNOLOGY INTENDED FOR TRACEABILITY AND SUPPLY CHAIN21

582 by Shamsuzzoha et al. (2023) called Tracey focuses on the mobile-based solution
583 approach, the study found that the most widely used smartphone type in the
584 Philippines is the android phone which is where the Tracey prototype is intended
585 to be used. The Tracey app allows fishermen to log their catch details and buyers
586 to verify and update transaction history (Shamsuzzoha et al., 2023) . The Tracey
587 app uses a central database for storing fish trading data and a decentralized ledger
588 or blockchain for traceability purposes. The decentralized ledger acts as a tamper-
589 proof copy of the data recorded by fishermen and buyers. The result of the study
590 finds that fishermen are open to using digital methods for payments and confiden-
591 tiality which is required for exporting the fish product to maintain high standards
592 for traceability, catch certification, and product quality. The usage of blockchain
593 as exemplified by the Tracey project can be used for upholding the restriction
594 for IUU due to its ability to ensure transparent trade, consistent records, and
595 accessibility. The result and discussion of the study of Shamsuzzoha et al. (2023)
596 provides a solution for improving the sustainability of tuna fishery and ensures
597 that Filipino fishermen receive fair compensation. For the study limitation of the
598 Tracey project, although there is a high acceptability of potentially using the app
599 for fishermen, there are still constraints in terms of proper incentives, connectivity
600 issues, technology usability, and education for using the app.

601 A study of Cocco and Mannaro (2021) proposed a blockchain-based technology
602 in the traceability of the supply chain management of a traditional Italian food
603 product, Carasau bread, which is made from durum wheat flour, salt, yeast and
604 water. Since the production of this product is traditional, consumers would de-
605 mand for transparency on the methods used in the Carasau bread production to
606 ensure authenticity. The proposed model involves the combination of the appli-

cation of Internet of Things (IoT), specifically the Radio Frequency Identification (RFID) sensors and Interplanetary File System (IPFS) with Blockchain (Cocco & Mannaro, 2021) . RFID is a technology that uses radio frequencies to identify and track a tagged object while IPFS allows files to be stored and tracked over a decentralized and distributed file system. Cocco and Mannaro (2021) also stated that using RFID tags that will be integrated with different sensors to monitor food quality will be useful in their study. These sensors include freshness indicators to monitor the food quality when packaged, biosensors to detect degradation molecules, time temperature indicator to measure and record temperature and humidity sensors to detect the amount of water vapor in the atmosphere. The integration of IoT and blockchain technology can have a huge impact in increasing traceability in agri-food supply chain. Moreover, this study proposed to have a generic agri-food traceability system which will be based on Ethereum blockchain, Radio-frequency identification (RFID), Near Field Communication (NFC), and Interplanetary File System (IPFS) technology. Moreover, the model proposal also includes sensor network devices, smart contacts, optical cameras and an external database. Each IoT device will be connected to Raspberry Pi and interfaces with blockchain implementing smart contracts and IPFS which authorities can inspect every node and batch online through the uploaded files in IFPS; hashes of the uploaded files on IFPS are also stored on blockchain (Cocco & Mannaro, 2021) . In this way, users along the chain supply can view and trace each batch using the NFC tags promoting transparency and traceability. Overall, the proposed model is a combination of two subsystems. The first one is an on-chain system which is the blockchain implementing smart contracts and will be developed using Solidity, an object-oriented language. The second one is an off-chain system that will be implemented in Javascript using Node.js (to interact with the smart contracts)

633 and Web3.js packages (to interact with blockchain) and these packages should be
634 installed on the Raspberry Pi. However, the purpose of this study is to exam-
635 ine the traceability systems of the agri-food industry and further provide possible
636 solutions.

637 **2.10 Developing a Traceability System for Tuna 638 Supply Chains**

639 The study of Kresna et al. (2017) , proposed an IT-based traceability system
640 for tuna supply chain as opposed to the traditional paper based traceability sys-
641 tem which has several limitations such as the potency to be manipulated, error
642 by the human, language barrier, and physical damage. The architecture com-
643 prises several layers: infrastructure, data, application, communication, and user
644 layers. The infrastructure layer includes computer hardware, network infrastruc-
645 ture, and sensing devices like CCTV, GPS, and RFID for data acquisition. The
646 data layer serves as the system's database, featuring both a main system database
647 and an emergency database for critical situations. The application layer consists
648 of various modules—admin, tracing, transporter, supplier, and government—that
649 registered actors can access through different interfaces. Finally, the user layer
650 consists of the registered actors who utilize the system.

651 The journal article of Tiwari (2020) called Application of Blockchain in Agri-
652 Food Supply Chain conducted two case studies for a blockchain driven app built
653 for supply chain related to food, fishing, and agriculture. The first case-study is
654 the usage and effectiveness of the Provenance system for tuna tracking certifica-

tion. The objective of the Provenance system is to enhance transparency in the tuna supply chain by ensuring certification and standard compliance across all roles(e.g. supplier, retailer) in the chain. The system is built using six modular programs: registering, standards, production, manufacturing, tagging, and user-interface. The usage of blockchain in the Provenance system allows transactions to be recorded to allow shared ledger for transparency and smart contracts for secure exchanges of money or information. The usage of the Provenance system is to solve the issues encountered in the tuna fishing industry affected by various factors such as illegal, unregulated, unauthorized (IUU) fishing, fraud, and human rights abuses. The solution of the Provenance system is to allow tracking, tracing, and certification of tuna using blockchain. The Provenance system has a smart tagging feature that allows fishermen to use SMS for digital assets on the blockchain to track where the fish, in return, all supply chain stakeholders can access the data that was sourced from the SMS. The second case-study is the usage of the IBM Food Trust for transparency in the food supply chain. The IBM Food Trust aims to solve the problems in the food supply chain, specifically in product safety. Locating supply chain items in real-time using identifiers like GTIN or UPC is the primary feature of the IBM Food Trust. The app also provides end-to-end product provenance, real-time location and status, and facilitates rapid product recalls. The IBM Food Trust also provides insights and visibility for the freshness of the product to reduce losses and spoilage. Lastly, the IBM Food Trust provides certifications from the information taken when handling and managing the products in the supply chain. The case studies conducted by Tiwari (2020) illustrates the potential of blockchain technology in improving transparency, efficiency, and ethical practices within supply chains.

⁶⁸⁰ **2.11 Chapter Summary**

2.11.1 Comparison Table of Related Studies

Study	Technology Used	Focus Area	Application	Key Findings	Limitations
Shamsuzzoha et al. (2023)	Blockchain (hybrid model)	Fish traceability	Mobile app (Tracey) for fishermen and buyers	Demonstrated feasibility for traceability, certification, transparency; high user acceptability among fishermen	Connectivity issues, technology usability, need for proper incentives and education
Cocco & Mannaro (2021)	Blockchain, IoT (RFID, IPFS), NFC, Ethereum	Italian traditional food (Carasau bread)	Agri-food supply chain traceability system	Proposed a model combining IoT and blockchain to enhance traceability and transparency	High complexity; requires integration of multiple technologies (RFID, IPFS, NFC)
Kresna et al. (2017)	IT-based system, RFID, CCTV, GPS	Tuna supply chain	Digital traceability system (IT-based)	Identified weaknesses in traditional paper-based systems; proposed IT layers for comprehensive tracking	Infrastructure requirements (CCTV, GPS, RFID); limited detail on blockchain
Tiwari (2020) - Provenance	Blockchain, smart contracts, SMS	Tuna tracking certification	Provenance system for tuna supply chain	Enhanced transparency, certification compliance; addressed IUU fishing, fraud, human rights abuses	Limited to specific regions and roles within supply chain
Tiwari (2020) - IBM Food Trust	Blockchain, GTIN/UPC identifiers	Food supply chain	Real-time tracking, product recalls	Improved transparency, efficiency; enabled real-time status, freshness insights	Focused on general food products; high dependency on IBM ecosystem

Table 2.1: Comparison of Studies on Technology for Traceability and Supply Chain Management

⁶⁸¹ **2.11.2 Research Gaps and Problem**

⁶⁸² Given the advanced existing technologies in blockchain-based traceability systems

⁶⁸³ for agri-food supply chains, significant gaps remain in understanding the user ex-

684 perience and integration challenges faced by the fishermen. While the study by
685 Shamsuzzoha et al. (2023) highlighted the feasibility and benefits of the mobile
686 application, Tracey, they overlooked possible issues related to technology adop-
687 tion, digital literacy, and connectivity.

688 Furthermore, existing technologies have primarily focused on large-scale imple-
689 mentations and theoretical frameworks without adequately considering the prac-
690 tical implications and user experience needed for effective system integration. This
691 study aims to address these gaps by exploring real-world challenges faced by users,
692 especially fishermen, in adopting blockchain technology for traceability.

693 **2.11.3 Summary**

694 The literature reviewed highlighted the critical challenges and opportunities re-
695 garding the tuna supply chain, particularly in the areas of traceability and sustain-
696 ability. Existing supply chain technologies, especially those utilizing blockchain,
697 present solutions but also come with limitations in terms of blockchain adoption.
698 The application of blockchain technology in the tuna supply chain has shown po-
699 tential for enhancing traceability from ocean to consumer.

700 Through this paper, a blockchain-driven solution could contribute to providing a
701 more efficient and transparent supply chain. However, further studies are neces-
702 sary to assess the long-term sustainability of blockchain in such systems.

⁷⁰³ Chapter 3

⁷⁰⁴ Research Methodology

⁷⁰⁵ This chapter outlines a clear and detailed description of the research methods and
⁷⁰⁶ processes used in the development and evaluation of SeaXChange: A Blockchain
⁷⁰⁷ Driven App for Tuna Supply Chain Management. The algorithms, systems, theo-
⁷⁰⁸ ries, framework and models are described in detail in which this chapter establishes
⁷⁰⁹ the foundation of this study .This chapter also explains the data collection method
⁷¹⁰ used ensuring the validity and reliability of the results.In addition, the chapter
⁷¹¹ discusses the considerations and potential limitations of this study. Overall, this
⁷¹² will serve as a guide for the readers in understanding the structured process of
⁷¹³ developing the SeaXChange.

⁷¹⁴ 3.1 Software Development

⁷¹⁵ Scrum is a framework within the Agile development that prioritizes flexibility.
⁷¹⁶ It is an iterative software development approach that lets a project be broken

717 down into phases and emphasizes continuous improvements. For this study, the
718 researchers opted to use Scrum because it involved many stakeholders and it
719 operated in a ever-changing environment. Scrum allowed the team to adapt to
720 new requirements through structured sprint planning, weekly reports, and sprint
721 reviews, ensuring continuous alignment with project goals.

722 **3.2 Research Activities**

723 For this study, the researchers opted for interviews because it enabled in-depth
724 exploration of stakeholder perspectives and experiences. The identified fisher and
725 supplier client interface was tested within the perimeters of Barangay Sapa, Miagao,
726 Iloilo, Philippines. The identified retailer testers were the vendors who reside
727 in Barangay Mat-y and Barangay Sapa in Miagao. The identified consumer testers
728 were situated in Miagao.

729 **3.2.1 Data Gathering**

730 • Primary Data:

- 731 – Stakeholder(Fishermen, Supplier, Retailers, and Consumers) interviews
732 were conducted to identify the use-case and user requirements, interface
733 usability, and adoption challenges.
- 734 – Observations were made of existing tuna supply chain processes in local
735 settings.

736 • Secondary Data:

- 737 – Literature review was conducted on blockchain applications in supply
738 chain management and product traceability.
- 739 – Industry reports and regulatory documents related to tuna fishing and
740 supply chain operations.

741 3.2.2 Designing and Developing the System

742 1. **Software Development Methodology:** The project followed a Scrum
743 framework to ensure continuous iteration, stakeholder involvement, and flex-
744 ibility in adapting to feedback.

745 2. **Technology Stack:**

- 746 • Front-end Development: Used React for creating a secure and user-
747 friendly interface for stakeholders, prioritizing simple and responsive
748 user-interface.
- 749 • Back-end Development: Used Node.js along with Express for managing
750 back-end processes and API integration. Express is a flexible web applica-
751 tion framework for Node.js used to build APIs for web applications.
752 Docker for containerization of the project and Windows Subsystem for
753 Linux (Ubuntu as the Linux distribution) for setting up the network.
- 754 • Cloud Infrastructure: Used Google Cloud to host backend services and
755 manage the databases, where the app could be accessed globally. It
756 also ensured the app could scale smoothly as more data and users were
757 added.
- 758 • Blockchain Framework: Used Go language for developing smart con-
759 tracts and providing an immutable ledger for transaction data.

- 760 • Database for Accounts: Used Firebase managing user accounts and
761 authentication.

762 **3. Blockchain Development Platform:**

- 763 • Used Hyperledger Fabric for its permissioned nature and scalable ar-
764 chitecture.
- 765 • The open-sourced resources and timely updates of Hyperledger Fabric
766 components is ideal for creating a distributed ledger for tuna supply
767 chain.

768 **3.2.3 Implementing Algorithms and Services**

769 The system for this study is built on top of a Hyperledger Fabric project, it also
770 utilized combinations of algorithms to facilitate the work flow of data or asset
771 as well as ensuring high security with encryption and decryption configuration
772 techniques.

773 **1. Consensus Algorithm**

774 The project followed Raft(Leader-based consensus) for handling organiza-
775 tions or nodes. Raft is intended for managing a replicated log in a blockchain
776 network. Raft is a Crash Fault Tolerant (CFT) protocol, is designed to han-
777 dle non-malicious node failures (e.g., hardware crashes, network issues) In
778 Raft, one node is elected as the leader, and it coordinates the ordering of
779 transactions (Xu et al, 2022) . The leader replicates log entries (transac-
780 tions) to follower nodes, ensuring consistency across the network.

781 **2. Cryptographic Algorithm**

782 The project employed several cryptographic algorithms to ensure security
783 and privacy. These cryptographic data served as digital signatures and iden-
784 tity verification for the project. ECDSA (Elliptic Curve Digital Signature
785 Algorithm) was used for generating digital signatures while X.509 certifi-
786 cates are intended for identity management and authentication of partic-
787 ipants (Anitha & Sankarasubramanian, n.d.) . For the encryption, AES
788 (Advanced Encryption Standard) was used for encrypting data at rest and
789 in transit. TLS (Transport Layer Security) secured communication between
790 network nodes. SHA-256 (Secure Hash Algorithm-256) ensured data in-
791 tegrity by generating unique hashes for blocks and transactions.

792 **3. Membership Service**

793 The implementation of the Membership Service Provider (MSP) requirement
794 involved a set of folders added to the network configuration. These folders
795 defined an organization both internally, by specifying its administrators,
796 and externally, by enabling other organizations to verify the authority of
797 entities attempting specific actions. While Certificate Authorities (CAs)
798 are responsible for generating the certificates that represent identities, the
799 MSP included a list of permitted identities. The MSP specified which Root
800 CAs and Intermediate CAs are authorized to define members of a trust
801 domain. This was achieved by either listing the identities of their members
802 or identifying the CAs allowed to issue valid identities for those members.

803 **4. Ordering Service**

804 The ordering service in this study played a crucial role in maintaining the
805 integrity and functionality of the blockchain network. Its primary respon-

sibilities included ensuring that transactions are processed in the correct sequence (transaction ordering), grouping transactions into blocks based on configurable parameters like size or timeout (block creation), and distributing these ordered blocks to peers for validation and commitment (block distribution) (Nassar et al, 2024). Additionally, the ordering service provided fault tolerance to ensure the network remains operational even in the presence of node failures through Raft.

813 5. Endorsement Policy

814 Fabric employs endorsement policies to specify which peers must validate a
815 transaction before it's committed. The algorithm involved multi-signature
816 schemes where a transaction is valid if it receives endorsements from the
817 required peers as per the policy.

818 6. Chaincode (Smart Contract)

819 The handling and flow of business logic agreed to by members of the tuna
820 supply chain in the blockchain network is executed by a chaincode or smart
821 contract. The chaincode of the app was written in Go language. Docker
822 container was used for enabling the chaincode to securely run along with the
823 overall hyperledger fabric configurations. Chaincode initializes and manages
824 ledger state through transactions submitted by applications (Hyperledger
825 Fabric Documentation, 2024) . The chaincode followed the object-oriented
826 paradigm for creating classes and objects necessary for the tuna supply
827 chain.

828 3.2.4 Modeling the System Architecture

829 The system architecture of the project were consisted of many nodes that com-
830 municated with each other. The chaincode enabled the system to run algorithms,
831 particularly, holding state and ledger data, and executes transactions such as asset
832 transfer in the tuna supply chain.

833 • **Blockchain Architecture**

834 The project involved peer, ordering services, ledger, and client application
835 to perform various transaction such as tracing the origin and the stop points
836 of a tuna asset. Peers are nodes in the blockchain network that maintained
837 a copy of the distributed ledger and execute chaincode (smart contracts).
838 The ordering service is the central component of the blockchain for ordering
839 transactions and creating blocks to distribute to peers through consensus
840 mechanism. The ledger is the immutable record of all transaction in the
841 tuna supply chain network, stored across all peers. The client application is
842 the interface through which users or tuna supply chain participants interact
843 with the blockchain network.

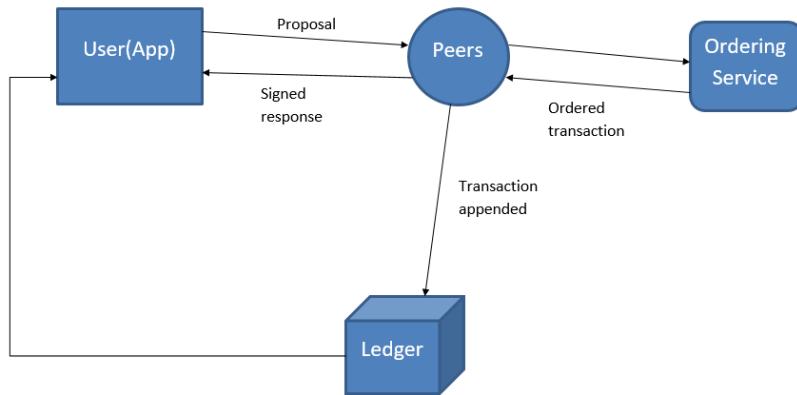

Figure 3.1: Blockchain Architecture of SeaXChange

• Overall System Architecture

The overall system architecture contains a web application built with Next.js for the frontend, utilizing Firebase for user authentication and account management. The application follows a role-based access model (Fisher, Supplier, Retailer, Consumer) where each role has specific permissions for interacting with tuna assets in the supply chain. The backend runs on Google Cloud Platform, consisting of an Express.js API that interfaces with a Hyperledger Fabric blockchain network (containerized in Docker) which stores and manages the immutable record of tuna assets and their transfers between supply chain participants. This architecture enables secure tracking of tuna from creation by fishers through the supply chain to consumers, with appropriate viewing and transfer capabilities assigned to each role in the process.

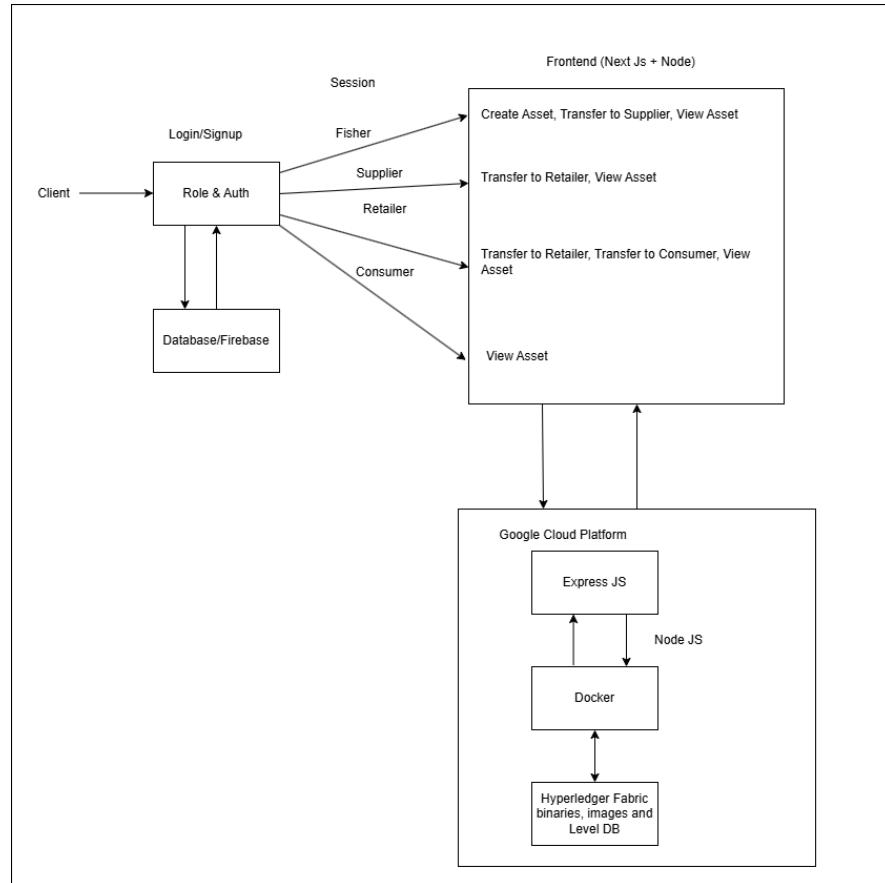

Figure 3.2: Overall System Architecture of SeaXChange

857 • **Use Case**

858 The use case shows the outline on how the user will interact with the SeaX-
 859 Change App. It followed the major stages or participants in the tuna supply
 860 chain.

861 1. **Fisher**

- 862 - Encodes tuna I.D. of fish.
 863 - Encodes the date when the fish was captured.
 864 - Encodes the location where the fish was captured.
 865 - Encodes the fishing method used.

866 - Query the origin and exchange of the tuna asset.

867 **2. Supplier**

868 - Encodes when the product was transferred from fisher to supplier.

869 - Query the origin and exchange of the tuna asset.

870 - Generate supplier's location during retrieval of tuna asset.

871 **3. Retailer**

872 - Encodes when the product was retrieved from the supplier or another
873 retailer.

874 - Query the origin and exchange of the tuna asset.

875 - Generate retailer's location during retrieval of tuna asset.

876 **4. Consumer**

877 - Retrieve data from retailer.

878 - Query the origin and exchange of the tuna asset.

879 There are four (4) types of users that will use the app. The first user
880 type is the Fisher, which will be the starting point of the blockchain.

881 It will encode the catch details of a tuna product such as the date of
882 capture, location, and fishing method. The second user type is the
883 Supplier, which will encode when the product was transferred from
884 the fisher to the supplier, as well as generate their location during
885 the retrieval of the tuna asset. The third type is the Retailer, which
886 will encode when the product was transferred from the supplier to the
887 retailer or in the case of multiple retailers, from the previous retailer to
888 the current retailer, their location is also generated during the retrieval
889 of the tuna asset. Lastly, the Consumers, which can only query the
890 origin and exchange of tuna assets.

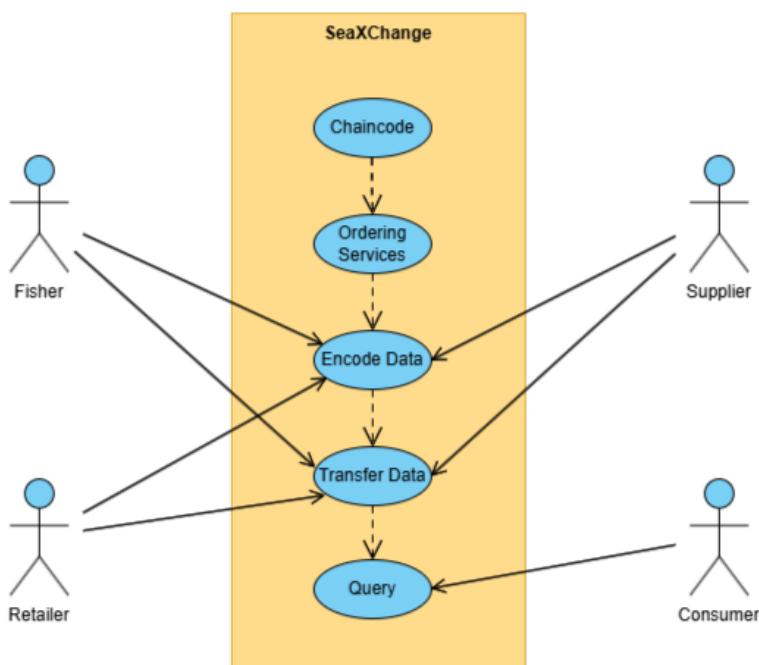

Figure 3.3: Use case diagram for SeaXChange.

⁸⁹¹ **Chapter 4**

⁸⁹² **Results and Discussions**

⁸⁹³ **4.1 Overview**

⁸⁹⁴ This chapter presents the preliminary results or the system prototype. Included
⁸⁹⁵ in this chapter are screenshots and the discussion of results. The tuna supply
⁸⁹⁶ chain management smart contract on Hyperledger Fabric has been initiated and
⁸⁹⁷ tested within a controlled blockchain environment. Results indicated that the
⁸⁹⁸ system was functionally robust and reliable, having managed assets, transaction
⁸⁹⁹ integrity, and the ability to query and update the ledger in the blockchain. This
⁹⁰⁰ chapter presents the details of the major steps executed during the process, results
⁹⁰¹ for those steps, and the current status of the prototype's operations.

902 **4.2 Smart Contract Deployment and Installation**

903

904 **4.2.1 Hyperledger Fabric Prerequisites**

905 Before executing a smart contract framework and blockchain system, it is cru-
906 cial to first install and set up the necessary tools and technologies. This includes
907 setting up Hyperledger Fabric, which involves installing the Fabric binaries, con-
908 figuring the network, and ensuring all necessary dependencies like Docker, Docker
909 Compose, and Node.js are installed and properly configured. Additionally, setting
910 up the required certificates, defining the channel configurations, and ensuring that
911 peer nodes and orderers are correctly connected and synchronized are all essential
912 steps in preparing the environment for blockchain and smart contract operations.

913 • **Software Requirements:**

- 914 – **Docker and Docker Compose:** Hyperledger Fabric needs to have
915 Docker installed and running on the system. Docker is required to run
916 the peer and ordering services of the blockchain system.
- 917 – **Node.js:** Required for the Fabric SDK for client application integra-
918 tion with JavaScript libraries such as react.
- 919 – **Go:** Ensure Go is installed, and the GOPATH environment variable
920 is set up. This is essential for building and running chaincode(smart
921 contract) written in Go.
- 922 – **Fabric Samples:** Clone the official Hyperledger Fabric's fabric-samples
923 repository from GitHub:

```
924     git clone -b release-2.4 --single-branch  
925         https://github.com/hyperledger/fabric-samples  
926     cd fabric-samples/test-network  
927
```

928 – **Binaries and Docker Images:**

```
929     curl -sSL https://bit.ly/2ysbOFE | bash -s
```

```
930
```

931 • **Network Setup:**

- ```
932 – Run the test-network script to start the Hyperledger Fabric test net-
933 work:
```

```
934 ./network.sh up
```

```
935
```

936 This script starts a peer, an ordering service, and a CA (Certificate  
937 Authority) on the local machine.

- ```
938     – After starting the network to docker in the same directory (test-network),  
939         a channel must be created:
```

```
940     ./network.sh createChannel
```

```
941
```

942 • **Deploying Chaincode (Smart Contract):**

- ```
943 – Step 1:
```

```
944 export PATH=${PWD}/../bin:$PATH
```

```
945
```

946 – Step 2:

```
947 export FABRIC_CFG_PATH=$PWD/./config/
```

948

949 – Step 3:

```
950 export CORE_PEER_TLS_ENABLED=true
951 export CORE_PEER_LOCALMSPID="Org1MSP"
952 export CORE_PEER_TLS_ROOTCERT_FILE=${PWD}/organizations
953 /peerOrganizations/org1.example.com/peers/peer0.org1.example.com
954 /tls/ca.crt
955 export CORE_PEER_MSPCONFIGPATH=${PWD}/organizations
956 /peerOrganizations/org1.example.com/users
957 /Admin@org1.example.com/msp
958 export CORE_PEER_ADDRESS=localhost:7051
959
960
```

### 961 4.2.2 Invoking the Blockchain System

962 After setting up the prerequisites, including Docker containers, the test network,  
 963 and chaincode, the tuna supply chain system can now be invoked for creating,  
 964 transferring, and querying tuna assets. The figures provided below demonstrate  
 965 the processes involved in invoking the blockchain system.

## 4.2. SMART CONTRACT DEPLOYMENT AND INSTALLATION

43

```
[root@rex2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]# peer chaincode query -C mychannel -n basic_cc -f "QueryAllAssets"
[{"ID": "tuna1", "Species": "Skipjack", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-01", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierX", "Retailer": "Reyes"}, {"ID": "tuna2", "Species": "Yellowfin", "Weight": 8.5, "CatchLocation": "Palawan", "CatchDate": "2024-12-02", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierY", "Retailer": "Cruz"}, {"ID": "tuna3", "Species": "Bluefin", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-03", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierZ", "Retailer": "Cruz"}, {"ID": "tuna4", "Species": "Albacore", "Weight": 6.5, "CatchLocation": "Sulu", "CatchDate": "2024-12-04", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierA", "Retailer": "MA"}, {"ID": "tuna5", "Species": "Albacore", "Weight": 6, "CatchLocation": "Davao", "CatchDate": "2024-12-05", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierB", "Retailer": "Retailery"}]
[rexx2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]
```

Figure 4.1: Query Smart Contract: Check assets

### 966 • Adding new tuna assets:

967 Here, a new tuna asset is created and registered on the blockchain. This in-  
 968 volves invoking the smart contract to add a new entry, which includes details  
 969 such as the type of tuna, quantity, and any other relevant information. This  
 970 step ensures that newly caught or acquired tuna can be tracked throughout  
 971 the supply chain.

```
[root@rex2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]# peer chaincode invoke -o localhost:7050 --ordererTLSHostnameOverride orderer.example.com --tlsRootCertFile $PWD/organizations/ordererOrganizations/example.com/msp/tlscacerts/tlscacert.pem -C mychannel -n basic_cc -peerAddresses localhost:7051 --tlsRootCertFiles $PWD/organizations/peerOrganizations/org1.example.com/peers/peer0.org1.example.com/tls/ca.crt" --peerAddressTLSHeader "SkipProof" -f "2024-12-06T10:00:00Z" >>> [chaincodeCmd] chaincodeInvokeOrQuery >> Chaincode invoke successful, result: status:200
[rexx2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]
```

Figure 4.2: Invoke Smart Contract: Create/Add new tuna asset

### 972 • Check all assets after adding a new tuna asset:

973 After adding a new tuna asset, the smart contract is queried again to verify  
 974 that the asset has been successfully added. This step confirms that the new  
 975 asset is part of the current inventory and that no discrepancies exist in the  
 976 recorded data.

```
[root@rex2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]# peer chaincode query -C mychannel -n basic_cc -f "QueryAllAssets"
[{"ID": "tuna1", "Species": "Skipjack", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-01", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierX", "Retailer": "Reyes"}, {"ID": "tuna2", "Species": "Yellowfin", "Weight": 8.5, "CatchLocation": "Palawan", "CatchDate": "2024-12-02", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierY", "Retailer": "Cruz"}, {"ID": "tuna3", "Species": "Bluefin", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-03", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierZ", "Retailer": "Cruz"}, {"ID": "tuna4", "Species": "Albacore", "Weight": 6.5, "CatchLocation": "Sulu", "CatchDate": "2024-12-04", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierA", "Retailer": "MA"}, {"ID": "tuna5", "Species": "Albacore", "Weight": 6, "CatchLocation": "Davao", "CatchDate": "2024-12-05", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierB", "Retailer": "Retailery"}, {"ID": "tuna6", "Species": "Albacore", "Weight": 6, "CatchLocation": "Antique", "CatchDate": "2024-12-06", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "MA", "Retailer": "MA"}]
```

Figure 4.3: Query Smart Contract: Check assets with new tuna asset

### 977 • Transfer tuna asset to Supplier:

978 This step involves transferring ownership of a tuna asset from the current

holder (e.g., a fisherman or a trader) to a supplier. The smart contract is invoked to facilitate the transfer, ensuring that the transaction is securely recorded on the blockchain and that the asset's new owner is updated accordingly.

```
979 holder (e.g., a fisherman or a trader) to a supplier. The smart contract is
980 invoked to facilitate the transfer, ensuring that the transaction is securely
981 recorded on the blockchain and that the asset's new owner is updated ac-
982 cordingly.

[Error: error getting broadcast client: orderer client failed to connect to orderer.example.com:7050: failed to create new connection: context deadline exceeded
983 txe2002LAPTOP-Q93QUN8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network$ peer chaincode invoke -o localhost:7050 --ordererTLSHostnameOverride orderer.example.com --tlsCafile ./msp/tlscacerts/tlscacert.pem --tlsCertFile ./msp/tlscacerts/tlscacert.pem --peerAddresses localhost:9051 --tlscertFiles ./msp/tlscacerts/tlscacert.pem --peerOrganizations org1.example.com/peers/peer0.org1.example.com/tls/ca.crt --function "transferAsset" "A
984 rg":["tuna6","Supplier","SupplierA"]]

```

Figure 4.4: Invoke Smart Contract: Transfer asset to a supplier

#### 983 • Check the updated tuna asset:

984 After the transfer, the smart contract is queried once more to check if the  
985 asset details have been updated correctly. This step verifies that the asset's  
986 new owner is now the supplier and that all relevant information is correctly  
987 updated on the blockchain.

```
988 After the transfer, the smart contract is queried once more to check if the
989 asset details have been updated correctly. This step verifies that the asset's
990 new owner is now the supplier and that all relevant information is correctly
991 updated on the blockchain.

[Error: error getting broadcast client: orderer client failed to connect to orderer.example.com:7050: failed to create new connection: context deadline exceeded

```

Figure 4.5: Query Smart Contract: Check asset after transfer

#### 988 • Transfer tuna asset to Retailer:

989 Similar to the supplier transfer, this step involves transferring the tuna asset  
990 from the supplier to a retailer. The smart contract facilitates this transfer,  
991 ensuring that ownership is correctly updated and that the retailer has control  
992 over the tuna asset. This step is crucial for the supply chain as it moves the  
993 tuna from bulk supply to retail.

```
994 Similar to the supplier transfer, this step involves transferring the tuna asset
995 from the supplier to a retailer. The smart contract facilitates this transfer,
996 ensuring that ownership is correctly updated and that the retailer has control
997 over the tuna asset. This step is crucial for the supply chain as it moves the
998 tuna from bulk supply to retail.

[{"ID": "tuna6", "Species": "Skipjack", "Weight": 6, "CatchLocation": "2024-12-05T", "CatchDate": "Antique", "FishingMethod": "Longline", "Vessel": "Jagney", "Supplier": "SupplierA", "Retailer": "RetailerA"}, {"ID": "tuna6", "Species": "Skipjack", "Weight": 6, "CatchLocation": "2024-12-05T", "CatchDate": "Antique", "FishingMethod": "Longline", "Vessel": "Jagney", "Supplier": "SupplierA", "Retailer": "RetailerB"}]
```

Figure 4.6: Invoke Smart Contract: Transfer asset to a retailer

### 4.3. BACKEND SECURITY ANALYSIS (HYPERLEDGER FABRIC ON GCP)45

994     ● **Check the updated tuna asset:**

995     After the transfer to the retailer, another query is made to verify the updated  
996     asset details. This step ensures that the transaction was successful and that  
997     the retailer now has ownership of the tuna asset. It confirms that the asset  
998     has moved through the supply chain correctly.

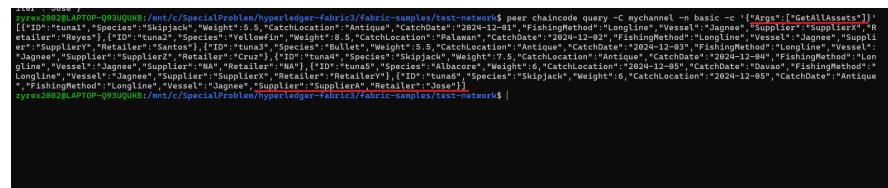

```
zyrex2082@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/Fabric-samples/test-network$ peer chaincode query -C mychannel -n basic -c '{"Args":["ReadAsset","tuna6"]}'
[{"ID": "tuna6", "Species": "Skipjack", "Weight": 6.5, "CatchLocation": "Antique", "CatchRate": "200-12-01", "FishingMethod": "Longline", "Vessel": "Jagnee", "Supplier": "SupplierA", "Retailer": "Jose"}]
zyrex2082@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/Fabric-samples/test-network$
```

Figure 4.7: Query Smart Contract: Check asset after transfer

999     ● **Query Smart Contract and check updated assets:**

1000   The final step involves querying the smart contract to get a complete overview  
1001   of all the assets in the supply chain. This includes all tuna assets from fishing  
1002   to retail, allowing stakeholders to monitor and manage inventory effectively.  
1003   It provides traceability in the supply chain, helping to maintain freshness  
1004   and authenticity of the tuna as it moves through the market.

```
zyrex2082@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/Fabric-samples/test-network$ peer chaincode query -C mychannel -n basic -c '{"Args":["getAllAssets"]}'
[{"ID": "tuna1", "Species": "Skipjack", "Weight": 6.5, "CatchLocation": "Antique", "CatchRate": "200-12-01", "FishingMethod": "Longline", "Vessel": "Jagnee", "Supplier": "SupplierA", "Retailer": "Reyes"}, {"ID": "tuna2", "Species": "Yellowfin", "Weight": 8.5, "CatchLocation": "Palawan", "CatchDate": "2024-12-02", "FishingMethod": "Longline", "Vessel": "Jagnee", "Supplier": "SupplierA", "Retailer": "Santos"}, {"ID": "tuna3", "Species": "Bluefin", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-03", "FishingMethod": "Longline", "Vessel": "Jagnee", "Supplier": "SupplierA", "Retailer": "Santos"}, {"ID": "tuna4", "Species": "Albacore", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-04", "FishingMethod": "Longline", "Vessel": "Jagnee", "Supplier": "SupplierA", "Retailer": "Reyes"}, {"ID": "tuna5", "Species": "Albacore", "Weight": 6, "CatchLocation": "2024-12-05", "CatchDate": "2024-12-05", "FishingMethod": "Longline", "Vessel": "Jagnee", "Supplier": "SupplierA", "Retailer": "Reyes"}, {"ID": "tuna6", "Species": "Skipjack", "Weight": 6, "CatchLocation": "2024-12-05", "CatchDate": "2024-12-05", "FishingMethod": "Longline", "Vessel": "Jagnee", "Supplier": "SupplierA", "Retailer": "Jose"}]
zyrex2082@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/Fabric-samples/test-network$
```

Figure 4.8: Query Smart Contract: Check updated assets

1005 **4.3 Backend Security Analysis (Hyperledger Fab-**

1006 **ric on GCP)**

1007 **4.3.1 System Architecture and Deployment Overview**

1008 The backend of the system's tuna assets was developed using a containerized  
1009 Hyperledger Fabric deployed on Google Cloud Platform (GCP). The network of  
1010 Hyperledger Fabric consists of a peer node, an ordering node, and Certificate  
1011 Authorities (CAs).

1012 **4.3.2 Blockchain Network Security**

1013 The blockchain network leverages Hyperledger Fabric's security model to ensure  
1014 authenticated transactions and controlled access. A Membership Service Provider  
1015 (MSP) manages identities and issues certificates based on a Public Key Infrastruc-  
1016 ture (PKI) model, ensuring that only verified participants can interact with the  
1017 network.

1018 Key security features include:

1019 **Channel Privacy**

1020 Channels act as private communication subnets, isolating transaction data so that  
1021 only authorized organizations can access and process specific transactions.

**1022 Policies and Access Control**

**1023 Policies**, including endorsement policies and access control lists (ACLs), govern  
**1024** how transactions are validated, how channel resources are accessed, and how  
**1025** changes to the network are approved. Endorsement policies specifically define  
**1026** which peer nodes must approve a transaction before it is committed to the ledger.

**1027 Secure Communication**

**1028 Transport Layer Security (TLS)** is enforced across node communications to protect  
**1029** data in transit. Mutual TLS is used for operational endpoints like monitoring  
**1030** services.

**1031 Identity and Role Management**

**1032 Every network participant**—peer nodes, orderer nodes, client applications (SeaX-  
**1033 Change Web Application**)—has a cryptographically verifiable identity, with roles  
**1034** defined within the framework to control access and permissions within channels.

**1035 Hardware Security Modules (HSMs)**

**1036 Critical cryptographic operations**, such as signing transactions under the blockchain  
**1037 assets invocation**, can optionally be handled by HSMs to secure private keys out-  
**1038 side of the software environment.**

**1039** These layered mechanisms collectively ensure the confidentiality, integrity, and

1040 authenticity of transactions in the blockchain network.

### 1041 4.3.3 Smart Contract Automated Test Result

1042 To validate the security and functionality of the deployed smart contracts on the  
 1043 Hyperledger Fabric network, an automated testing script (app.js) under asset-  
 1044 transfer-basic directory was executed. The script interacted with the blockchain  
 1045 network through the gateway application, utilizing the defined channel (mychan-  
 1046 nel) and chaincode (basic). The automated tests performed the following opera-  
 1047 tions:

#### 1048 InitLedger Transaction

1049 The ledger was initialized by creating a predefined set of tuna asset entries. The  
 1050 transaction was successfully committed, confirming the proper initialization of  
 1051 asset data. (See Figure 4.9 for initialization confirmation.)

```

 }
]
--> Submit Transaction: UpdateAsset asset70, asset70 does not exist and should return an error
*** Successfully caught the error: Asset asset70 does not exist.
```

Figure 4.10: Initialization Confirmation of the Ledger

#### 1057 CreateAsset Transaction

1058 A new asset was successfully created and appended to the blockchain. The trans-  
1059 action was committed without errors, validating the chaincode's ability to handle  
1060 new data insertion.

#### 1061 TransferAsset Transaction

1062 Ownership transfer of an existing asset was simulated. The transaction was suc-  
1063 cessfully submitted and committed, demonstrating the correct application of asset

<sup>1064</sup> updates in the blockchain ledger.

### <sup>1065</sup> **ReadAsset Query**

<sup>1066</sup> The updated asset was retrieved and verified to ensure the correctness of the  
<sup>1067</sup> transfer. The retrieved asset data reflected the changes made through the previous  
<sup>1068</sup> transaction, confirming data consistency.

### <sup>1069</sup> **UpdateAsset Error Handling**

<sup>1070</sup> An attempt to update a non-existent asset (asset70) was performed to test the  
<sup>1071</sup> smart contract's error-handling mechanism. The application correctly caught and  
<sup>1072</sup> reported the error, verifying that improper transactions are adequately handled  
<sup>1073</sup> and rejected.

### <sup>1074</sup> **Summary of Results**

<sup>1075</sup> All positive transactions (initialization, creation, transfer, and reading) were suc-  
<sup>1076</sup> cessfully executed and committed. The smart contract exhibited robust error  
<sup>1077</sup> handling during invalid operations. Endorsement policies and Membership Ser-  
<sup>1078</sup> vice Provider (MSP) enforcement ensured transaction authenticity and integrity  
<sup>1079</sup> during the process. These tests confirm the functional reliability and transac-  
<sup>1080</sup> tion security of the smart contracts used within the tuna supply chain blockchain  
<sup>1081</sup> network.

1082 **4.3.4 GCP Infrastructure Security**

1083 The Hyperledger Fabric network deployment on Google Cloud Platform (GCP)  
1084 was secured by leveraging multiple layers of Google's infrastructure security model,  
1085 following best practices in network, identity, and data protection.

1086 **Firewall Rules and Network Control**

1087 Only essential ports (e.g., 7051 for peer communication and 7050 for the ordering  
1088 service) were opened to minimize network exposure. GCP's VPC firewall rules,  
1089 ingress and egress controls, and options like VPC Service Controls help further  
1090 isolate services and prevent unauthorized access. Traffic between virtual machines  
1091 and Google APIs is securely routed through Google's internal network infrastruc-  
1092 ture using Private Google Access when available.

1093 **IAM Roles and Access Management**

1094 The principle of least privilege was enforced by assigning minimal permissions to  
1095 users and services through GCP Identity and Access Management (IAM). Access  
1096 decisions involve authentication, authorization checks, and enforcement of policies  
1097 through centralized services, helping reduce the risk of unauthorized actions or  
1098 privilege escalation.

**1099 Encryption**

1100 GCP ensures that data is encrypted both at rest and in transit by default. Storage  
1101 systems use multiple layers of encryption, with cryptographic keys managed by  
1102 Google. For additional control, Cloud Key Management Service (KMS) enables  
1103 customers to manage their own encryption keys. Data in transit between services  
1104 is protected using Application Layer Transport Security (ALTS), and all external  
1105 communication with Google services is encrypted via TLS.

**1106 Access Control**

1107 Access to virtual machines and services was restricted using secure access methods.  
1108 Identity-Aware Proxy (IAP) or VPN connections were employed to safeguard SSH  
1109 and administrative access. GCP's zero-trust model emphasizes verifying identity  
1110 and device security rather than relying solely on network location, aligning with  
1111 best practices for modern infrastructure protection.

**1112 Infrastructure and Operational Security**

1113 GCP's underlying infrastructure benefits from Google's proprietary hardware de-  
1114 signs, including the Titan security chip, secure boot mechanisms, and service iden-  
1115 tity enforcement. Google's physical data centers use multi-layered defenses such  
1116 as biometrics and intrusion detection systems. Operational security practices, in-  
1117 cluding binary authorization and extensive monitoring, reduce insider risks and  
1118 enforce software integrity throughout the lifecycle.

#### *4.3. BACKEND SECURITY ANALYSIS (HYPERLEDGER FABRIC ON GCP)53*

1119 By deploying the blockchain network on GCP, the project leveraged a highly se-  
1120 cure environment, benefiting from Google's layered security architecture across  
1121 networking, identity management, encryption, access control, and operational  
1122 practices.

##### **1123 4.3.5 Threat Model and Mitigations**

1124 Potential threats to the system were identified and mitigation strategies were  
applied, as summarized in Table 4.1.

| <b>Threat</b>                   | <b>Mitigation</b>                             |
|---------------------------------|-----------------------------------------------|
| Unauthorized access to network  | Use of MSP and Certificate Authorities        |
| Tampering with transactions     | Endorsement policies and consensus mechanisms |
| Denial of Service (DoS) attacks | GCP Firewall and rate limiting rules          |
| Data leakage                    | Private channels and access controls          |

## 1127 4.5 Operational Flow of the Web Application

1128 This section will discuss the flow in using the SeaXChange Web Application. It  
1129 will show the respective interface for every page and how the users can interact  
1130 with it.

### 1131 4.5.1 Landing Page

1132 Users are be greeted with the landing page, where it shows a ocean visuals and  
1133 a tagline “Discover the Journey your tuna made from the ocean to your dinner  
1134 plate”. Users are given the option to Login, where they are redirected to the login  
1135 page or Get Started, where they are redirected to the sign up page.

Figure 4.12: Landing Page

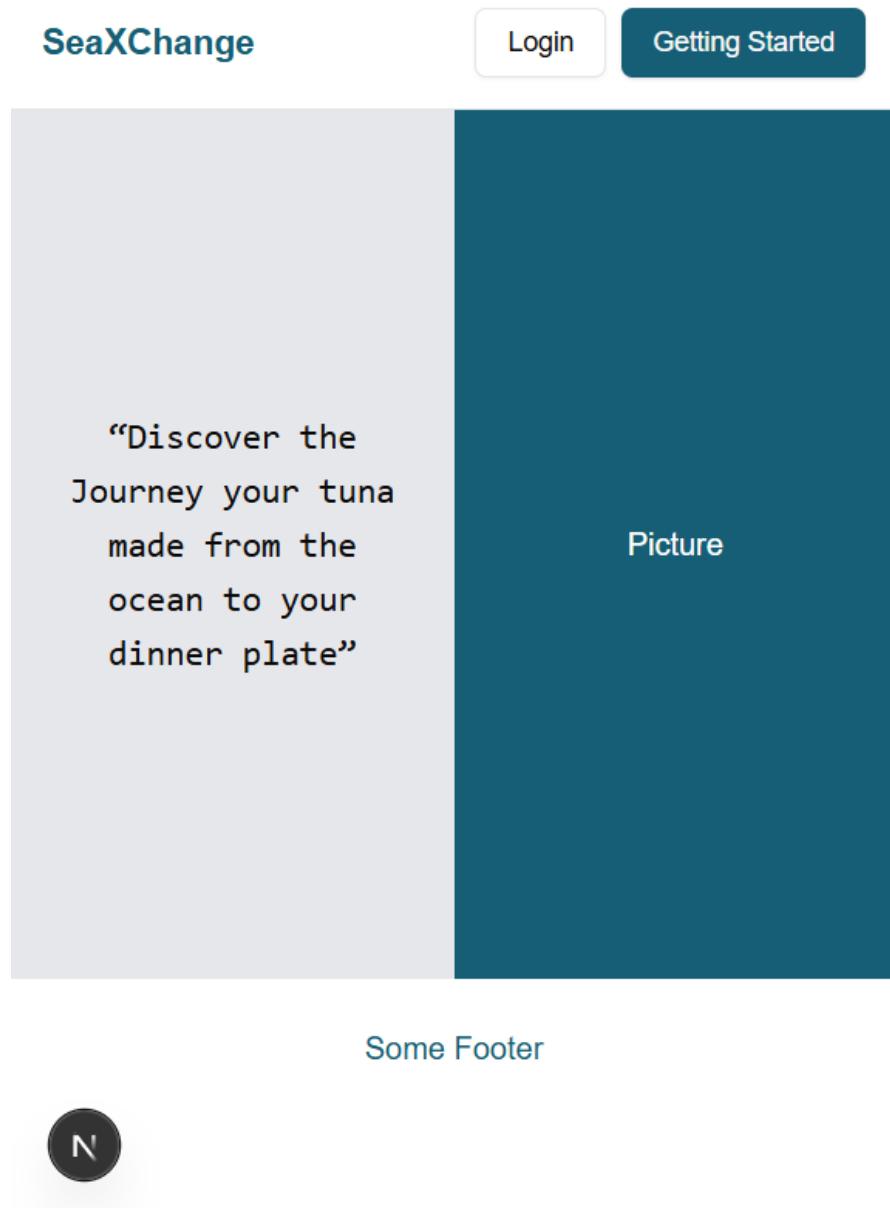

Figure 4.13: Mobile View: Landing Page

<sub>1136</sub> **4.5.2 Sign Up Page**

<sub>1137</sub> First time users will be required to create an account. They are to provide their  
<sub>1138</sub> name, email and password. For their user type, there are four roles to choose  
<sub>1139</sub> from: Fisher, Supplier, Retailer and Consumer.

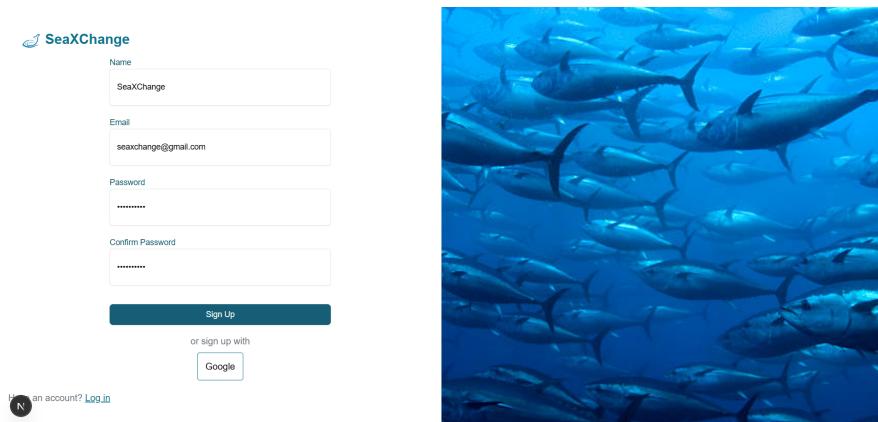

Figure 4.14: SignUp Page

<sub>1140</sub> **4.5.3 Login Page**

<sub>1141</sub> Returning user are required to login with their email and password.

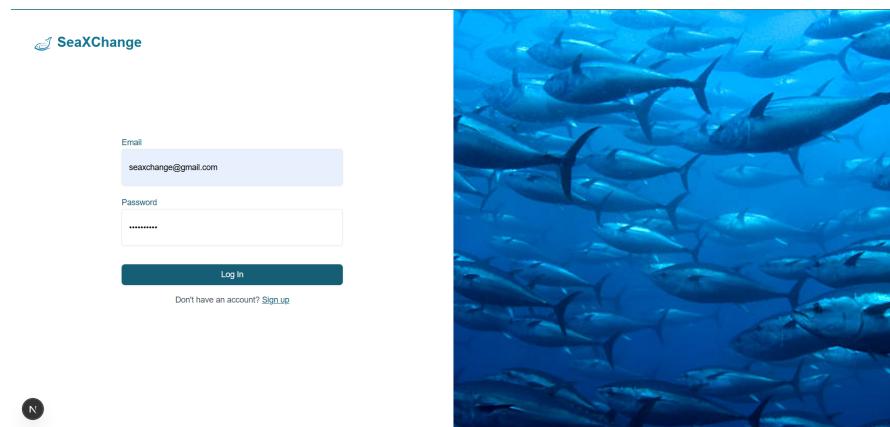

Figure 4.15: LogIn Page

<sub>1142</sub> **4.5.4 Homepage**

<sub>1143</sub> Each user type has their own respective homepages and features.

- <sub>1144</sub> • **Fisher** Fishers can add a fish catch using the "Add catch" button, where they are to input the species of the fish, weight in kg, catch location, catch date, fishing method used and vessel name. The remaining text fields like the Supplier name, Retailer name and Consumer name are left null and cannot be edited because they will be filled out by the other users receiving the tuna asset. Users can send a tuna asset to the Supplier. Users can also browse existing tuna assets.

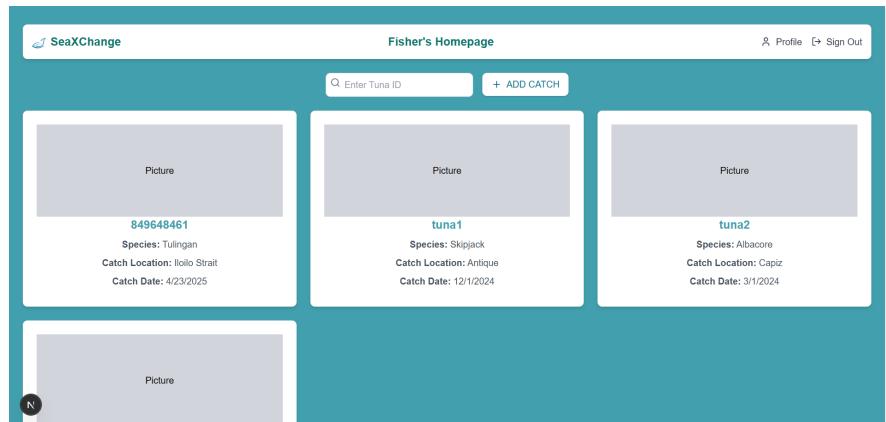

Figure 4.16: Fisher Homepage

- <sub>1151</sub> • **Supplier** Suppliers can browse existing tuna assets. Upon clicking a tuna asset, the user can only edit the Supplier text field. They can send the tuna asset to the Retailer.

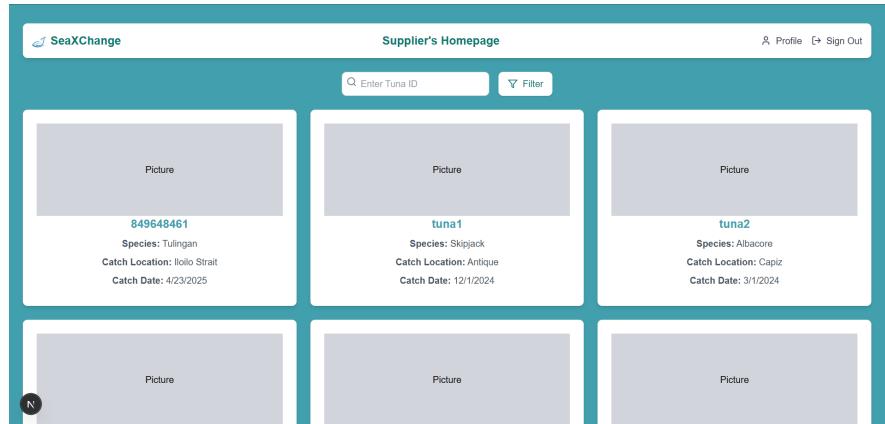

Figure 4.17: Supplier Homepage

- 1154 • **Retailer** Retailers can browse existing tuna assets and can send it to the  
1155 Consumer.

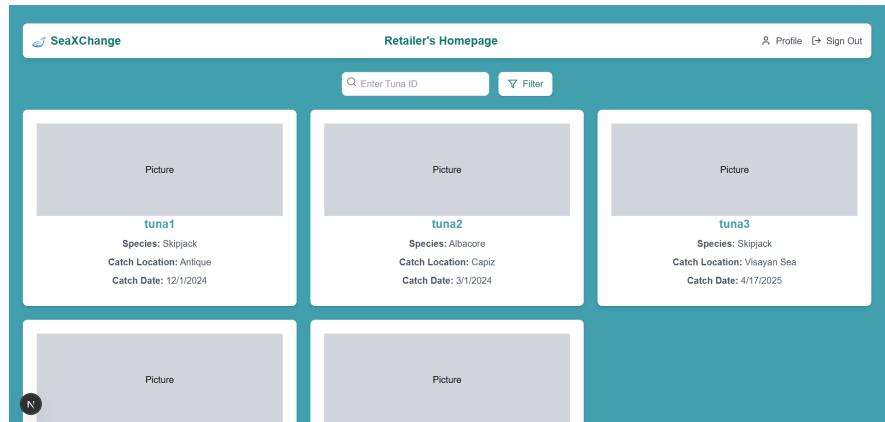

Figure 4.18: Retailer Homepage

- 1156 • **Consumer** Consumers can only view the tuna asset and cannot edit anything else  
1157

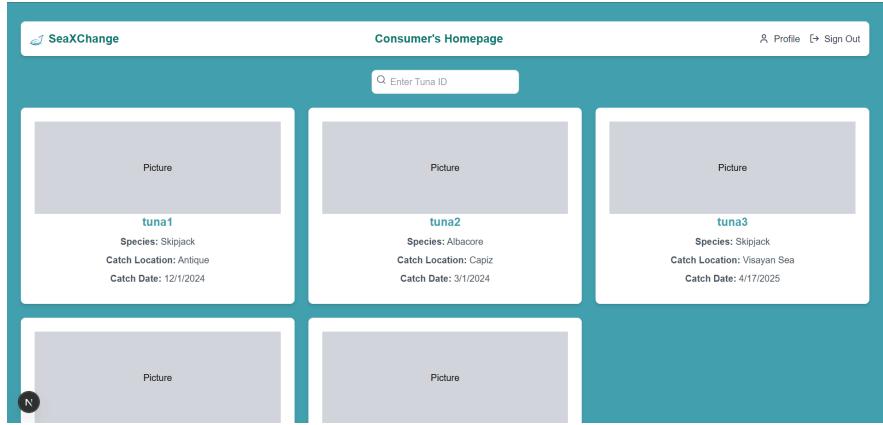

Figure 4.19: Consumer Homepage

### 1158 4.5.5 Profile

1159 The user's profile information is shown on the homepage through a pop-up. It  
1160 shows the user's name and role.

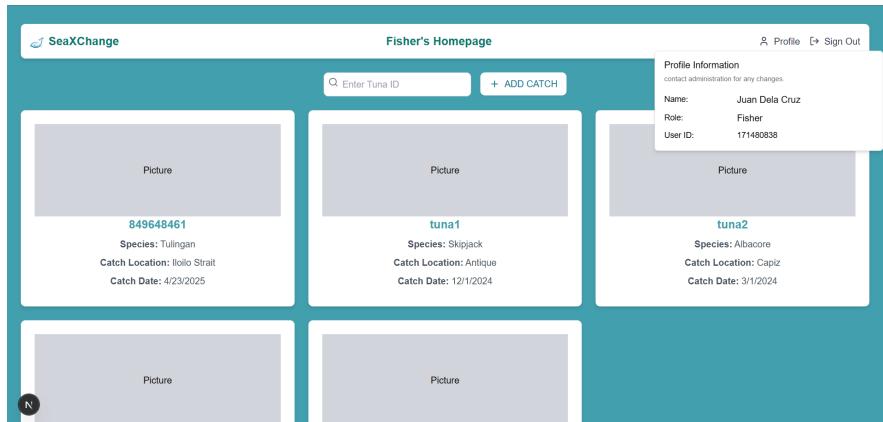

Figure 4.20: View Profile

### 1161 4.5.6 Logout

1162 Users can logout of their accounts and is redirected to the Signup Page.

## <sup>1163</sup> 4.6 System Discussion

<sup>1164</sup> After modifying the Hyperledger Fabric smart contract to assess necessary pro-  
<sup>1165</sup> cesses involved in the tuna supply chain, the blockchain is ready to be invoked  
<sup>1166</sup> wherein the smart contract can be activated. To start, a new tuna asset is added  
<sup>1167</sup> and registered to the blockchain. Each tuna asset has its attributes or details.  
<sup>1168</sup> Before proceeding to the transfer of tuna asset, the smart contract is queried to  
<sup>1169</sup> verify if the creation of the asset is successful and if it is part of the current in-  
<sup>1170</sup> ventory. After that, the tuna asset can be transferred from fisher to supplier and  
<sup>1171</sup> the asset's owner is updated. The smart contract is queried again to verify if the  
<sup>1172</sup> asset details have been updated successfully. With the same process, the tuna as-  
<sup>1173</sup> set is transferred from supplier to retailer using the smart contract and the owner  
<sup>1174</sup> is updated again. To ensure that the asset details are successfully updated, the  
<sup>1175</sup> smart contract is queried again. The final step is to query the smart contract to  
<sup>1176</sup> show the overview of all the assets in the supply chain. With this, it can be seen  
<sup>1177</sup> all the tuna assets from fishing to retail. Overall, the steps and process provides

<sup>1178</sup> transparency and traceability in the tuna supply chain.

## <sup>1179</sup> 4.7 User Demonstration and Feedback Results

### <sup>1180</sup> 4.7.1 Demo Setup and Scenario

<sup>1181</sup> During the demonstration of the system, the participants had a brief introduction  
<sup>1182</sup> of the key functionalities of the SeaXChange app. They were shown how to  
<sup>1183</sup> create an account, input and send tuna assets from one stakeholder to another.

<sup>1184</sup> Participants were also shown how real-time updates were reflected on the app.

<sup>1185</sup> Finally, they were introduced on how to view transaction histories and traceability  
<sup>1186</sup> information on each tuna asset. Throughout the demonstration, participants  
<sup>1187</sup> were encouraged to ask questions and provide feedback on the usability and func-  
<sup>1188</sup> tionality of the system. After the demonstration, they were given feedback forms  
<sup>1189</sup> in order to assess the SeaXChange app.

| Supplier Location | NA         |                                                                                     |
| Retailer          | NA         |                                                                                     |
| Retailer Location | NA         |                                                                                     |
| Consumer          | NA         |                                                                                     |

 Send Tuna

Figure 4.24: After Save Details

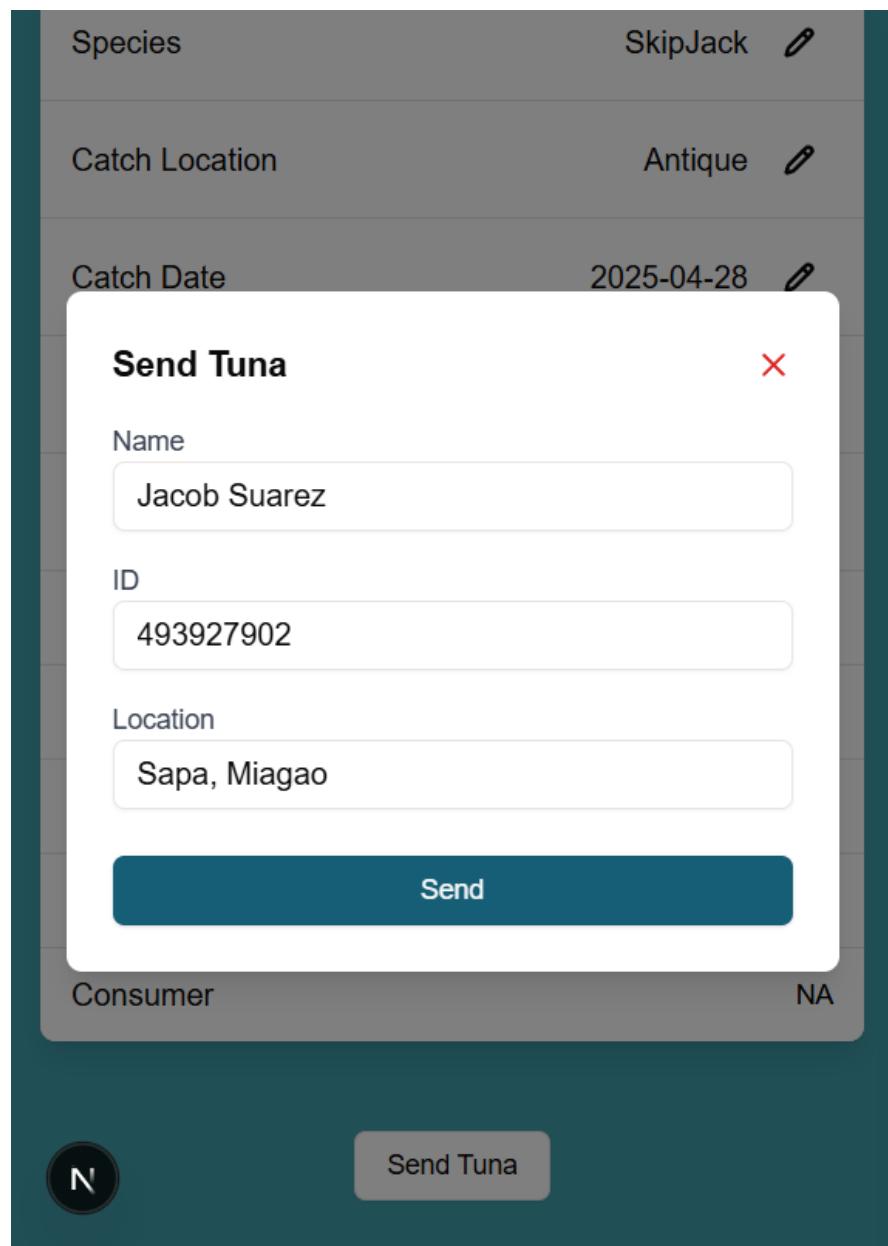

Figure 4.25: Send Asset

<sup>1190</sup> **4.7.2 Feedback Collection Method**

<sup>1191</sup> The feedback was collected through a combination of structured interviews and  
<sup>1192</sup> assessment forms. Participants were asked to complete an assessment rubric evalu-  
<sup>1193</sup> ating the SeaXChange app across key criteria such as functionality, end-user needs,  
<sup>1194</sup> performance, usability, ease of use and feasibility. Moreover, follow-up interviews  
<sup>1195</sup> were conducted to gather deeper qualitative insights and obtain suggestions for  
<sup>1196</sup> system improvement.

<sup>1197</sup> The feedback gathered from fishermen, suppliers and retailers, and consumers  
<sup>1198</sup> was analyzed based on the SeaXChange assessment rubric, which evaluated six  
<sup>1199</sup> major categories: Functionality, End-user Needs, Performance, Usability, Ease of  
<sup>1200</sup> Use and Feasibility. The collected data were analyzed using descriptive statistics,  
<sup>1201</sup> through the computation of mean scores for each assessment criterion. These  
<sup>1202</sup> mean values were used to summarize stakeholder perceptions of the system. Mean  
<sup>1203</sup> ratings were calculated based on the 1-5 Likert Scale where 1 = Poor and 5 =  
<sup>1204</sup> Very Good.

<sup>1205</sup> **4.7.3 Summarized Feedback**

| Functionality                   | Stakeholder            | Mean | Description |
|---------------------------------|------------------------|------|-------------|
| Track assets                    | Entire Group           | 3.67 | Average     |
|                                 | Fishermen              | 4.0  | Good        |
|                                 | Supplier and Retailers | 3.0  | Average     |
|                                 | Consumers              | 4.0  | Good        |
| Verify tuna assets              | Entire Group           | 3.67 | Average     |
|                                 | Fishermen              | 3.33 | Average     |
|                                 | Supplier and Retailers | 4.0  | Good        |
|                                 | Consumers              | 3.67 | Average     |
| Support real-time updates       | Entire Group           | 3.56 | Average     |
|                                 | Fishermen              | 3.78 | Average     |
|                                 | Supplier and Retailers | 4.0  | Good        |
|                                 | Consumers              | 4.0  | Good        |
| Enable smart contract execution | Entire Group           | 3.42 | Average     |
|                                 | Fishermen              | 2.33 | Fair        |
|                                 | Supplier and Retailers | 3.25 | Average     |
|                                 | Consumers              | 4.67 | Good        |

Table 4.2: Mean ratings and descriptions for functionality-related features per stakeholder group.

<sup>1206</sup> When taken as a whole, the respondents have average feedback in asset tracking  
<sup>1207</sup> but when classified by stakeholder, the fishermen ( $M = 4.0$ ) and consumers ( $M$   
<sup>1208</sup>  $= 4.0$ ) had good feedback in tracking , while the supplier and retailers have an  
<sup>1209</sup> average rating ( $M = 3.0$ ). For verifying tuna assets, the entire group has an average  
<sup>1210</sup> feedback. When classified by stakeholder, the fishermen ( $M = 3.33$ ) and consumers  
<sup>1211</sup> ( $M = 3.67$ ) have average ratings. For real-time updates, the respondents, when  
<sup>1212</sup> taken as a whole, have an average feedback. When classified by stakeholder, the  
<sup>1213</sup> fishermen ( $M = 3.78$ ) have an average rating, while both supplier and retailers ( $M$   
<sup>1214</sup>  $= 4.0$ ) and consumers ( $M = 4.0$ ) have good ratings. For smart contract execution,  
<sup>1215</sup> the respondents, when taken as a whole, also have an average feedback. When  
<sup>1216</sup> classified according to stakeholder, the fishermen have a fair rating ( $M = 2.33$ ),

- <sup>1217</sup> the supplier and retailers have average ratings ( $M = 3.25$ ) and the consumers have  
<sup>1218</sup> good ratings ( $M = 4.67$ ).

| End-user Needs                   | Stakeholder            | Mean | Description |
|----------------------------------|------------------------|------|-------------|
| Provide transparency in tracking | Entire Group           | 3.56 | Average     |
|                                  | Fishermen              | 2.67 | Fair        |
|                                  | Supplier and Retailers | 4.0  | Good        |
|                                  | Consumers              | 4.0  | Good        |
| Provide seamless interaction     | Entire Group           | 3.77 | Average     |
|                                  | Fishermen              | 1.33 | Poor        |
|                                  | Supplier and Retailers | 3.0  | Average     |
|                                  | Consumers              | 4.0  | Good        |

Table 4.3: Mean ratings and descriptions for end-user needs-related features per stakeholder group.

- <sup>1219</sup> The respondents, when taken as a whole, had an average feedback in transparency.  
<sup>1220</sup> When classified by stakeholder, The fishermen have fair ratings ( $M = 2.67$ ), while  
<sup>1221</sup> both supplier and retailers ( $M = 4.0$ ) and consumers ( $M = 4.0$ ) have good ratings.  
<sup>1222</sup> In evaluating the seamless interaction of the app, the entire group has an average  
<sup>1223</sup> feedback ( $M = 3.77$ ). When classified by stakeholder, the fishermen ( $M = 1.33$ )  
<sup>1224</sup> have poor feedback, the supplier and retailers have average feedback ( $M = 3.0$ )  
<sup>1225</sup> and the consumers have good feedback ( $M = 4.0$ ) in seamless interaction.

| Performance                         | Stakeholder            | Mean | Description |
|-------------------------------------|------------------------|------|-------------|
| Processes transactions efficiently  | Entire Group           | 3.81 | Average     |
|                                     | Fishermen              | 3.67 | Average     |
|                                     | Supplier and Retailers | 3.75 | Average     |
|                                     | Consumers              | 4.0  | Good        |
| Ensures data integrity and security | Entire Group           | 3.31 | Average     |
|                                     | Fishermen              | 2.67 | Fair        |
|                                     | Supplier and Retailers | 3.25 | Average     |
|                                     | Consumers              | 4.0  | Good        |

Table 4.4: Mean ratings and descriptions for performance-related features per stakeholder group.

1226 As a whole, the respondents have an average feedback on efficient transactions ( $M$   
 1227 = 3.81). If evaluated per stakeholder, both fishermen ( $M = 3.67$ ), supplier and  
 1228 retailers ( $M = 3.75$ ) evaluated average while consumers had good feedback ( $M =$   
 1229 4.0). For data security, the entire group has an average feedback ( $M = 3.31$ ). The  
 1230 fishermen have fair evaluation ( $M = 2.67$ ), supplier and retailers ( $M = 3.25$ ) have  
 1231 an average and consumers have solid scores ( $M = 4.0$ ).

| Usability                                      | Stakeholder            | Mean | Description |
|------------------------------------------------|------------------------|------|-------------|
| Provides intuitive interface                   | Entire Group           | 3.83 | Average     |
|                                                | Fishermen              | 4.0  | Good        |
|                                                | Supplier and Retailers | 3.5  | Average     |
|                                                | Consumers              | 4.0  | Good        |
| Allows cross-platform accessibility            | Entire Group           | 4.14 | Good        |
|                                                | Fishermen              | 4.0  | Good        |
|                                                | Supplier and Retailers | 3.75 | Average     |
|                                                | Consumers              | 4.67 | Good        |
| Clear, structured, and visually appealing info | Entire Group           | 3.80 | Average     |
|                                                | Fishermen              | 3.33 | Average     |
|                                                | Supplier and Retailers | 3.75 | Average     |
|                                                | Consumers              | 4.33 | Good        |

Table 4.5: Mean ratings and descriptions for usability-related features per stakeholder group.

1232 It shows the frequency of intuitive interface among the respondents when taken  
 1233 as a whole is average ( $M = 3.83$ ). When classified according to stakeholder,  
 1234 both fishermen ( $M = 4.0$ ) and consumers ( $M = 4.0$ ) have good ratings, while the  
 1235 supplier and retailers ( $M = 3.5$ ) have average ratings. For cross-platform usage,  
 1236 the entire group rated good ( $M = 4.14$ ). When classified according to stakeholder,  
 1237 both fishermen ( $M = 4.0$ ) and consumers ( $M = 4.1$ ) also have good ratings, while  
 1238 supplier and retailers ( $M = 3.75$ ) have average. For visual clarity, the entire group  
 1239 rated average ( $M = 3.80$ ). When classified by each stakeholder, both fishermen  
 1240 ( $M = 3.33$ ) and supplier and retailers ( $M = 3.75$ ) have average ratings, while

<sub>1241</sub> consumers ( $M = 4.33$ ) have good ratings.

| <b>Ease of Use</b>               | <b>Stakeholder</b>     | <b>Mean</b> | <b>Description</b> |
|----------------------------------|------------------------|-------------|--------------------|
| Clear instructions for new users | Entire Group           | 3.89        | Average            |
|                                  | Fishermen              | 4.0         | Good               |
|                                  | Supplier and Retailers | 4.0         | Good               |
|                                  | Consumers              | 3.67        | Average            |
| Uses clear and simple language   | Entire Group           | 3.31        | Average            |
|                                  | Fishermen              | 4.03        | Good               |
|                                  | Supplier and Retailers | 3.75        | Average            |
|                                  | Consumers              | 4.33        | Good               |

Table 4.6: Mean ratings and descriptions for ease of use-related features per stakeholder group.

1242 When taken as a whole, the respondents ( $M = 3.89$ ) rated instruction clarity as  
 1243 average. When classified by stakeholder, both fishermen ( $M = 4.0$ ) and supplier  
 1244 and retailers ( $M = 4.0$ ) have good feedback regarding instruction clarity, while the  
 1245 consumers ( $M = 3.67$ ) have average feedback. The entire group rated language  
 1246 clarity as average ( $M = 3.31$ ). When evaluated by each stakeholder, both fisher-  
 1247 men ( $M = 4.03$ ) and consumers ( $M = 4.33$ ) have good feedback, while supplier  
 1248 and retailers ( $M = 3.75$ ) have average feedback.

| <b>Feasibility</b>                  | <b>Stakeholder</b>     | <b>Mean</b> | <b>Description</b> |
|-------------------------------------|------------------------|-------------|--------------------|
| Integration with tuna industry      | Entire Group           | 4.06        | Good               |
|                                     | Fishermen              | 4.0         | Good               |
|                                     | Supplier and Retailers | 4.5         | Good               |
|                                     | Consumers              | 3.67        | Average            |
| Consumer use to track tuna products | Entire Group           | 4.03        | Good               |
|                                     | Fishermen              | 4.0         | Good               |
|                                     | Supplier and Retailers | 3.75        | Average            |
|                                     | Consumers              | 4.33        | Good               |

Table 4.7: Mean ratings and descriptions for feasibility-related features per stakeholder group.

1249 When taken as a whole, it shows that the respondents have good feedback in the  
 1250 system integration. When classified by each stakeholder, both the fishermen ( $M =$

1251 4.0) and supplier and retailers ( $M = 4.5$ ) have good feedback in system integration,  
1252 while the consumers( $M = 3.67$ ) have an average rating. The frequency of consumer  
1253 use among stakeholders, when taken as a whole, have good feedback ( $M = 4.03$ ).  
1254 When analyzed individually, both the fishermen ( $M = 4.0$ ) and consumers ( $M =$   
1255 4.33) have a good rating, while an average rating for the supplier and retailers ( $M$   
1256 = 3.75).

#### 1257 4.7.4 Results and Analysis

1258 For functionality, fishermen rated asset tracking positively but identified chal-  
1259 lenges in real-time updates and smart contract execution. Suppliers and retail-  
1260 ers similarly found strengths in verification and real-time updates, although as-  
1261 set tracking averaged slightly lower. Consumers consistently rated functionality  
1262 highly, particularly appreciating the system's ability to support smart contracts.

1263 Regarding end-user needs, fishermen provided the lowest ratings, highlighting dif-  
1264 ficulties with seamless interaction. Suppliers, retailers, and consumers gave higher  
1265 scores, suggesting that while transparency was generally achieved, the system's  
1266 ease of interaction required further improvement for all users.

1267 In terms of performance, fishermen and suppliers reported average transaction  
1268 efficiency but noted concerns regarding data integrity and security. Consumers,  
1269 on the other hand, expressed confidence in both areas.

1270 For usability, consumers provided the highest ratings, emphasizing the intuitive  
1271 design and accessibility of the interface. Fishermen and suppliers also rated us-  
1272 ability positively but suggested improvements, such as better visual appeal and

1273 language localization. Feedbacks suggested incorporating the Karay-a language  
1274 since most of the potential users uses that language in their everyday lives. An-  
1275 other suggestion was to use capitalization (UI/UX) for the name of the tuna to  
1276 give more emphasis to it.

1277 Ease of use was generally rated positively across all groups. However, feedback  
1278 highlighted the need for additional user guidance features, including clearer button  
1279 descriptions and localized instructions for broader accessibility.

1280 Finally, feasibility was strongly affirmed by all groups. Stakeholders believed the  
1281 system could be effectively integrated into the existing tuna supply chain and  
1282 accessed by consumers as a means to monitor tuna products.
