Dedication

36 This Special Problem, SeaXChange: A Blockchain-Driven App for Tuna Sup-
37 ply Chain Management, is dedicated to those who were instrumental in its creation
38 and purpose:

39 To our esteemed adviser and mentor, **Francis D. Dimzon, Ph.D.**, for his
40 invaluable guidance, expertise, and unwavering support throughout our research
41 journey.

42 To the members of the **Miagao community**, particularly the fishermen, sup-
43 pliers, and retailers from **Barangay Sapa**, and the consumers from **Barangay**
44 **Mat-y**—your daily experiences and challenges in ensuring transparent pricing,
45 product tracking, and maintaining fish product quality served as the foundational
46 motivation for this study. Your participation and insights were crucial.

47 To **Engr. Noel Lucero**, whose valuable perspectives during interviews pro-
48 vided essential context for understanding current trends and issues in the tuna
49 supply chain and the fishing industry as a whole.

50 To our fellow Special Problem classmates and colleagues—for the collabora-
51 tion, shared challenges, and mutual support that made this academic endeavor
52 more enriching.

53 And most importantly, to our beloved families—for their constant love, encour-
54 agement, understanding, and sacrifices that enabled us to pursue and complete
55 this work.

56 This Special Problem paper stands as a testament to your support and as a

⁵⁷ contribution toward addressing the challenges faced within the tuna supply chain.

Acknowledgment

59 Our deepest appreciation goes to our thesis adviser, **Francis D. Dimzon**,
60 **Ph.D.**, for his expertise, patient guidance, and unwavering support. We are also
61 grateful to **Christi Florence C. Cala-or**, panelist, for her insightful feedback
62 and suggestions that enriched this study.

63 We thank the **University of the Philippines Visayas**, particularly the **Di-**
64 **vision of Physical Sciences and Mathematics**, College of Arts and Sciences,
65 for providing the academic foundation and resources. We also acknowledge the
66 **Computer Science Faculty** for equipping us with essential skills in software
67 engineering.

68 Special thanks are extended to the **Institute of Marine Fisheries and**
69 **Oceanology**. We particularly recognize **Ricardo P. Babaran Ph.D.**, , for his
70 valuable insights into the state of the tuna supply chain, existing technologies,
71 and the importance of supporting marginalized groups within it. We also thank
72 **Carmelo Del Castillo, Ph.D.**, for sharing related insights from prior thesis
73 work on the tuna supply chain.

74 To our fellow Special Problem classmates and colleagues—thank you for the
75 shared learning experiences, collaboration, and mutual support that made this
76 academic journey more fulfilling.

77 The successful implementation of SeaXChange was made possible through the
78 use of several tools and platforms. We acknowledge **Google Cloud Platform**
79 for hosting our backend services and blockchain network, and the **Hyperledger**
80 **Fabric** open-source framework, along with its documentation and community, for

81 providing a robust foundation for our blockchain system.

82 We extend our gratitude to the community participants and organizations in
83 **Miagao** who generously shared their time and perspectives. Our sincere thanks
84 go to the respondents—fisherfolk, suppliers, retailers, and consumers—whose real-
85 world experiences were vital to this study. We especially thank **Jerome F. Ca-**
86 **batuan** and **Veronica Jeruta** for facilitating access and participation within
87 their respective communities. We also acknowledge **Jagnee Fishing Corpora-**
88 **tion** and **Engr. Noel Lucero** for sharing their knowledge of the fish industry,
89 fishing vessels, and the tuna supply chain.

90 Finally, and most importantly, we extend our heartfelt thanks to our families
91 for their unwavering love, encouragement, sacrifices, and patience throughout the
92 duration of this study.

93 This thesis is a culmination of the support and collaboration of all those men-
94 tioned. We hope that this work contributes meaningfully to improving trans-
95 parency and efficiency in the tuna supply chain.

Abstract

97 The tuna supply chain faces critical challenges regarding traceability, transparency
98 and sustainability, particularly due to certain issues such as illegal, unreported and
99 unregulated (IUU) fishing. Ensuring the traceability within the tuna supply chain
100 is a critical role in enhancing consumer confidence, transparency and promoting
101 adherence to environmental and legal standards. This research explores the appli-
102 cation of blockchain technology as a solution to these given issues. By combining
103 qualitative insights gathered from different key stakeholders across the supply
104 chain, the researchers evaluated the potential of blockchain to improve product
105 traceability, accountability, and trust. The findings suggests that blockchain offers
106 a secure and transparent method of recording the journey of tuna products from
107 catch to market, helping to combat IUU fishing and promote sustainable practices.
108 However, successful implementation requires overcoming barriers related to tech-
109 nological integration, cost, and stakeholder collaboration. This study provides
110 valuable insights into the feasibility and impact of blockchain adoption within
111 other fish supply chains, contributing to the development of more transparent,
112 responsible, and sustainable tuna industries.

²⁴⁰ Chapter 1

²⁴¹ Introduction

²⁴² 1.1 Overview

²⁴³ The tuna supply chain faces critical issues that affect both the industry and its
²⁴⁴ consumers. Illegal fishing, overfishing, and poor traceability threaten the sustain-
²⁴⁵ ability and ethical trade. A lack of transparency compromises product quality
²⁴⁶ and misleads consumers. Blockchain technology can address these challenges by
²⁴⁷ tracking the tuna's journey from ocean to plate through a secure, tamper-proof
²⁴⁸ ledger. This system also holds stakeholders to comply to legal standards.

²⁴⁹ Although blockchain integration in the tuna sector is underway, gaps remain in its
²⁵⁰ implementation. This study helps to address the industry's need for transparent
²⁵¹ and secure tracking of tuna products from ocean to consumer, while assessing the
²⁵² feasibility of implementing blockchain at scale in the seafood sector.

²⁵³ **1.2 Problem Statement**

²⁵⁴ Fish is one of the most consumed protein products in the Philippines. Before the
²⁵⁵ COVID-19 pandemic, fish was the most consumed animal protein in the Philip-
²⁵⁶ pines with annual per capita consumption of 40 kg (Agriculture and Agri-Food
²⁵⁷ Canada, 2022). Among the wide variety of fish, tuna stands out as a particularly
²⁵⁸ significant commodity due to its high demand and economic value. Although the
²⁵⁹ nation is gifted with an abundance of aquatic resources, the methods of dispersal
²⁶⁰ of the product usually leads to inefficiency in terms of sales, pricing, and overall
²⁶¹ product quality for the consumers. The problem arises with the introduction of
²⁶² a supply chain from several middlemen between the fish farmer or producer and
²⁶³ wholesaler in the coastal and aquatic regions towards the consumers with less ac-
²⁶⁴ cess to fresh fish. Consequently, both consumers and suppliers struggle to ensure
²⁶⁵ transparent and fair pricing, accurately track tuna products, and maintain consis-
²⁶⁶ tent quality. These challenges stem from inefficient methods of product dispersal
²⁶⁷ and the presence of multiple intermediaries between fisherfolks in coastal munici-
²⁶⁸ palities and consumers. This fragmented supply chain introduces delays, obscures
²⁶⁹ product origin, and opens opportunities for mishandling or mislabeling. To ad-
²⁷⁰ dress this, the study focuses on the absence of a reliable, real-time traceability
²⁷¹ system that allows stakeholders to verify the origin, novelty, handling processes,
²⁷² and adherence to ethical sourcing practices of tuna at every stage. Without such
²⁷³ a system, the tuna supply chain and industry lack the transparency and account-
²⁷⁴ ability necessary to build consumer trust and improve supply chain efficiency. By
²⁷⁵ introducing a blockchain-driven solution, this study aims to streamline the trace-
²⁷⁶ ability process and reduce the negative impact of intermediary-heavy distribution.

²⁷⁷ **1.3 Research Objectives**

²⁷⁸ **1.3.1 General Objective**

²⁷⁹ The general objective of the study is to design and develop a blockchain-driven
²⁸⁰ application that improves the traceability of the tuna supply chain. Given the
²⁸¹ timely issues regarding illegal, unreported and unregulated (IUU) fishing and lack
²⁸² of product traceability and transparency, this study addresses these challenges
²⁸³ through an application that has the capability to provide an immutable ledger
²⁸⁴ and tamper-proof records. The result of this study serves as a framework for
²⁸⁵ integrating blockchain technology in the fish supply chain, specifically for tuna.
²⁸⁶ This also supports future researchers and developers facing similar challenges in
²⁸⁷ the industry.

²⁸⁸ **1.3.2 Specific Objectives**

²⁸⁹ To further specify the research objectives, the study focuses to:

- ²⁹⁰ 1. develop a smart contract framework using blockchain technology for data
²⁹¹ verification and transaction recording, ensuring secure and tamper-proof
²⁹² data for the stakeholders,
- ²⁹³ 2. design and develop a blockchain-driven application with a user-friendly in-
²⁹⁴ terface that allows stakeholders to access and input data while enhancing
²⁹⁵ traceability in the tuna supply chain through a tuna asset record for the
²⁹⁶ supply chain participants, and

297 3. deploy the application after completing all necessary preparations for soft-
298 ware development and to evaluate its overall results and effectiveness in en-
299 hancing the tuna supply chain, as discussed in the fourth and fifth chapters
300 of the study.

301 **1.4 Scope and Limitations of the Research**

302 The scope of this study focuses on how blockchain technology can be applied to
303 enhance traceability and transparency within the tuna supply chain. It involves
304 features such as smart contracts for recording the transactions and user interface
305 for stakeholders. The study also focuses exclusively on whole, small-sized caught
306 tuna products in the supply chain, excluding processed forms such as canned
307 or packaged tuna. The research examines the traceability of whole tuna from
308 capture to market sale, specifically centering on a supplier based in Miagao and
309 San Joaquin, Iloilo.

310 This study focuses solely on the supply chain in within the specified municipalities
311 of Iloilo, so findings may not fully represent global practices. As it concentrates
312 on blockchain's role in traceability, other potential functions of the technology fall
313 outside of the scope of this research.

314 **1.5 Significance of the Research**

315 This study serves a significant purpose for several stakeholders in the tuna supply
316 chain. This study aims to solve the problems related to the management of tuna

³¹⁷ supply chain, particularly with regards to product traceability.

³¹⁸ • The Stakeholders

³¹⁹ – This study enhances transparency and accountability, allowing stakeholders such as fishers, suppliers, and retailers to access tamper-proof and accurate information, thereby promoting a more ethical and authentic supply chain. By providing a digital record of the product's history, this study helps ensure compliance with environmental and legal standards. In cases of anomalies such as oil spills, red tide occurrences, and illegal fishing activities, stakeholders can be involved in identifying and addressing these issues, fostering a collaborative approach to sustainability. Similarly, the record of a tuna asset can be utilized for accountability purposes when problems such as damaged products, mislabeling, or contamination arise, allowing stakeholders to trace and resolve them efficiently.

³³¹ • The Consumers

³³² – This study helps consumers verify the history of the tuna product from its origin up until its journey to the consumers, therefore increasing trust and transparency. By promoting traceability, it offers a more detailed and verifiable record of the supply chain, enabling consumers to assess sustainability practices and identify stakeholders responsible for any potential issues affecting the tuna product. This, in turn, encourages critical evaluation of the tuna supply chain, driving improvements in accountability, resource management, and ethical sourcing.

340 • For Future Researchers

341 – As blockchain technology continues to grow, this study contributes to
342 the application of blockchain in the supply chain management and the
343 insights regarding its benefits and limitations. This research can be
344 helpful in the growing knowledge on digital solutions for traceability
345 and transparency for future research.

346 • The Policy Makers

347 – This study provides policy makers a reliable and data-driven founda-
348 tion in monitoring and regulating the tuna supply chain. By lever-
349 aging tamper-proof and transparent records, policymakers can more
350 effectively enforce compliance with fishing quotas and environmental
351 protections. This research also aids in lessening the illegal, unreported
352 and unregulated (IUU) fishing practices, contributing to the national
353 sustainability goals.

³⁵⁴ Chapter 2

³⁵⁵ Review of Related Literature

³⁵⁶ This chapter reviews existing literature related to the traceability of the tuna sup-
³⁵⁷ ply chain and the potential application of blockchain technology. In purchasing
³⁵⁸ goods, one important consideration is the product quality. An important factor
³⁵⁹ of determining the quality is to know the traceability of the supply chain. Trace-
³⁶⁰ ability refers to the ability of tracking the journey of the product from its source
³⁶¹ until its destination. The term “traceability” is now more utilized in both the
³⁶² food and production industry (Islam & Cullen, 2021). In the context of the tuna
³⁶³ supply chain, it can be used not only to promote transparency to consumers but to
³⁶⁴ also ensure compliance with environmental and legal standards. With blockchain
³⁶⁵ technology, the status of tuna at each stage could be recorded in the blockchain
³⁶⁶ which could be used for traceability. This paper aims to address the following
³⁶⁷ research question: How can blockchain technology improve the traceability of the
³⁶⁸ tuna supply chain management? To explore this, the chapter reviews literature
³⁶⁹ on the state of the tuna industry in the Philippines, fishing regulations, and the

370 structure of the tuna supply chain, including its stages and the roles of key actors.
371 It also examines factors that affect the efficiency and transparency of the supply
372 chain. The discussion then turns to blockchain technology and its potential ap-
373 plications in supply chain management, with examples from the Philippines and
374 Indonesia. Finally, the chapter reviews existing traceability technologies and sys-
375 tems and concludes with key insights that inform the development of this study's
376 proposed solution.

377 In purchasing goods, one thing to consider is the quality of it. An important part
378 of determining the quality is to know the traceability of the supply chain. Trace-
379 ability refers to the ability of tracking the journey of the product from its source
380 until its destination. The term “traceability” is now more utilized in both the
381 food and production industry (Islam & Cullen, 2021). In the context of the tuna
382 supply chain, it can be used not only to promote transparency to consumers but to
383 also ensure compliance with environmental and legal standards. With blockchain
384 technology, the status of tuna at each stage could be recorded in the blockchain
385 which could be used for traceability. This paper aims to address the following
386 research question: *How can blockchain technology improve the traceability of the*
387 *tuna supply chain management?*

388 2.1 State of Tuna Industry in the Philippines

389 In 2014, the Philippines became the top global producer of tuna according to
390 Llanto, et. al. (2018). The tuna is caught in domestic and international fishing
391 grounds near the country through various fishing methods such as purse seines,

392 gill nets, handline (hook and line) and ring net. Among the tuna species, the
393 skipjack tuna accounted for the largest portion of the catch by 40%. The study of
394 PCMARD (1993 as cited in Nepomuceno et al., 2020) stated that skipjack tuna
395 are often caught out in open waters or in offshore areas. In addition, Nepomuceno
396 et al. (2020) mentioned in their study that the dominant production of skipjack
397 tuna, together with yellowfin tuna, was recorded in South Cotabato. The tuna
398 supply has declined since 2000 due to various factors including overfishing, climate
399 change, and the laws and regulations imposed by different governing bodies for
400 the tuna fishing ground such as the Regulation No. 56, released by the Indone-
401 sian Maritime Affairs and Fisheries Ministry in November 2014. The regulation
402 imposed a moratorium on issuance of fishing licenses from 3 November 2014 to 30
403 April 2015 to eliminate illegal, unreported, and unregulated fishing in Indonesian
404 waters near Mindanao where tuna are known to thrive (Llanto et al, 2018). The
405 regulation imposed for the protection of tuna fishing grounds in the western and
406 central pacific ocean also lead to the decline of local tuna production which re-
407 quires the fishing operators of the Philippines to invest in the manufacturing and
408 processing of fish particularly tuna in Indonesia which includes hiring Indonesian
409 crew to be deployed in the Philippine fishing vessels (Llanto et al, 2018).

410 2.2 Fishing Regulations in the Philippines

411 A study of Asche et al. (2018) divided the fishing management strategies that
412 include right-based fishery management like territorial use of rights, access rights
413 and harvest rights. It discussed that a rights-based system could support the sus-
414 tainability of global fisheries by taking in account the three pillars of sustainability

415 (economic development, social development, and environmental protection) rather
416 than focusing on their trade-offs. A restriction on the fisherman's behavior by har-
417 vest rights and catch shares could be a profit problem for them in the short-run
418 but in the long-run, this could help both in the fish stock and the fishermen's
419 profit. Lack of restriction could lead to overfishing. Access rights limit the en-
420 try to fishery through permits which can also reduce the effect of high harvest
421 levels. A sustainable fishing management system in the Philippines is important
422 in order to preserve marine resources. To preserve these resources and protect
423 the livelihood of local communities, various fishing management strategies should
424 be implemented. A collaboration between the fishermen, local government and
425 other stakeholders often happens to manage marine resources (Pomeroy & Court-
426 ney, 2018). The study of Pomeroy and Courtney discussed that marine tenure
427 refers to the rights and responsibilities in terms of who can access the marine and
428 coastal resources. The 1998 Fisheries Code paved the way for local government
429 units (LGUs) to be involved in the management of municipal waters. LGUs are
430 given the responsibility to overlook and regulate fisheries and establish marine
431 tenure rights for fishers within 15 km from shore and these rights are applicable
432 for municipal fishers and their respective organizations that are listed in the reg-
433 istry (Pomeroy & Courtney, 2018). In this way, it resolved problems in terms of
434 fishing rights between small-scale and commercial fishing.

435 According to the study conducted by Mullon et al. (2017), the five major species of
436 tuna: yellowfin *Thunnus albacares*, bigeye *Thunnus obesus*, bluefin *Thunnus thyn-
437 nus* or *Thunus orientalis*, albacore *Thunnus alalunga*, and skipjack *Katsuwonus
438 pelamis* are harvested to meet the global supply chain demand which causes those
439 group of tuna fishes to be heavily exploited and threatened. The study conducted

440 by Paillin et al. (2022) states that there are multiple risk agents in the supply
441 chain assessment of tuna, these include the lack of standard environmental man-
442 agement system, lack of maintenance management, and lack of quality control
443 from suppliers. The usage of efficient boats and good quality catching technology
444 can also lead to fisheries depletion which causes various agency such as BFAR
445 (Bureau of Fisheries and Aquatic Resources), the local government units, and the
446 Philippine Coast Guard to enable policies for upholding closed fishing season to
447 restrict large scale fishing vessel to minimize the fishing activities in the identified
448 areas (Macusi et al, 2023). The implementation of closed fishing season caused de-
449 lay or lack of fish supply, which led to higher fish prices. The growing demands and
450 depleting population of tuna fishes coupled with the rapid increase in fuel costs
451 can have a negative impact on the future of the supply chain in tuna fisheries
452 (Mullon et al., 2017). With factors concerning the slow decline of tuna catches in
453 the Philippines and surrounding nations, the future of the global supply chain of
454 tuna must be addressed.

455 2.3 Tuna and Fish Supply Chain

456 According to Macusi et al (2023), the implementation of traceability programs in
457 the agricultural product commodities and value chain in the Philippines is slower
458 than its competing nation for tuna production. The Philippines has been steadily
459 responding to the market innovation and integration of cost-effective and smart
460 technologies for the traceability of various commodities. Accurate catch data is
461 crucial for determining the attributes of the fish health, size, volumes, and matu-
462 rity (Grantham et al, 2022) which can be used as a basis for the transparency of

463 the traceability of the fish product. Illegal, unreported, and unregulated (IUU)
464 is another concern for the fish industry. In the 2000s, the persistent IUU became
465 a global crisis affecting the biological, ecological, and socio-economics factors re-
466 volving around marine livelihood in Southeast Asia (Malinee et al, 2020). IUU
467 fishing is known to cause short- and long-term problems in the socio-economic
468 opportunities which affects food security and results in the possible collapse of
469 the fish industry and stocks due to overfishing (Malinee et al, 2020).

470 The establishment of marine protected areas in the Davao Gulf (MPAs) affected
471 the management of small-scale fisheries due to the growing population and de-
472 mands for seafood products. The closure of a wide range of fishing areas hosting
473 diverse and marine organisms has affected the socio-economics and livelihood of
474 the local and small-scale fishermen (Macusi et al, 2023), this in turn resulted
475 in IUU fishing. To ensure that fish stocks in the gulf are sustainably managed,
476 the implementation of GPS for tracking the movement and activities of fishers
477 through logbook and habitat monitoring can provide data and insights for track-
478 ing, monitoring, and understanding the condition of the marine resources (Obura
479 et al, 2019; Macusi et al, 2023).

480 2.4 Tuna Supply Chain Stages and Roles

481 The study conducted by Delfino (2023) highlights the roles of different actors in-
482 volved in the supply, production, distribution, and marketing of skipjack tuna in
483 Lagonoy Gulf in the Philippines. The study showcased a total of eleven intercon-
484 nected value chains but are generalized into four major stages or roles - fishers,

485 wholesalers, retailers, and processors. The fishers are the initial players responsible
486 for catching fish using boats or fishing vessels equipped with purse seines, gillnets,
487 and handlines(hook and line). Wholesalers are the actors for selling freshly caught
488 fish locally and regionally, they receive the fish supply directly from the fishers.
489 The next stage after wholesalers are the retailers, these intermediaries sell the fish
490 product to local markets, house-to-house (*libod*" in Visayan languages), and other
491 local medium such as *talipapa* or fish stands. Another intermediary is the proces-
492 sors, they convert fresh skipjack tuna into products like smoked tuna. The given
493 stages also overlapped in some cases as there are fisher-wholesalers who catch and
494 sell the fishes directly to retailers and there are also retailer-processors that both
495 sell whole and processed products. Despite having a firm system to transport fish
496 from sea to table, all the actors face problems during seasonal challenges involving
497 the availability of the tuna product. The fishers also need to consider strict local
498 regulations such as RA 10654 and RA 8550. The strict implementation of RA
499 10654 and RA 8850 at the local level or the Fisheries Code of the Local Philip-
500 pines aims to curb the problem encountered during season of deficit tuna supply
501 by limiting fishing activities and implementation of 15-km boundary lines in the
502 municipal waters of each municipality (Delfino, 2023). The study suggests that
503 improving conditions for value chain actors, particularly through support services
504 and government involvement could lead to a stable and sustainable exchange of
505 skipjack tuna and other seafood products from sea to table.

506 A study of Digal et al. (2017) discussed one of the value chains which was the
507 purse seine or the skipjack tuna value chain in the Philippines. Purse seining
508 is the method of catching a school of fish wherein it uses a large net around it,
509 trapping them and pulling the bottom of the net like a purse-like (Digal et al.,

510 2017) . This type of catching often targets dense fishes like tuna. Skipjack fishes
511 that weigh 300 grams and above are often sold to canneries, while the smaller ones
512 are sold at local markets, often used for consumption by Filipinos. Purse seiners
513 are usually employees of a fishing company and they have a fixed salary. They
514 could reach international waters so they need to bring their passports with them.
515 Jamboleros, who act as distributors, often buy from different fishing companies
516 per *banyera* or tub. They will then pack the fish and sell it to traders/truckers
517 who go to General Santos fishport. These traders will deliver it to the retailers
518 across Kidapawan who contacted them. There is no formal contract between the
519 jambolero and traders/truckers. One of the issues of the retailer is for everyday
520 that a fish is not sold, they would have a ₱10.00 less per kilogram.

521 2.5 Factors Affecting the Tuna Supply Chain

522 The tuna supply chain faced several factors and challenges for the safety and
523 quality of the product (Mercogliano & Santonicola, 2019). Without the proper
524 handling of the tuna after catching it can lead to various food-borne diseases and
525 outbreaks. The most frequent and mitigated food-borne causing compound is
526 Histamine(HIS) which causes Scombrotoxin fish poisoning (SPF) outbreaks re-
527 lated to food allergies when consumed (EFSA, 2017; Peruzy et al., 2017). Tuna
528 species are known for having high presence of amino acid histidine concentrations
529 which are converted to HIS by bacterial enzyme histidine-decarboxylase or HDS
530 (Aponte et al., 2018; Verkhivker & Altman, 2018). To combat the risk of SPF
531 and other food-borne diseases caused by tuna consumption, several safety hazards
532 and protocols were imposed to the tuna supply chain management. The term cold

533 chain refers to the storing of fish in temperatures less than 5°C after it was caught
534 (Yang & Lin, 2017). According to the article published by Mercogliano and San-
535 tonicola (2019), implementing a cold chain from the time the fish is caught until it
536 is consumed is crucial for mitigating the outbreak of HIS poisoning. Additionally,
537 the article also states that using high-quality raw tuna, cold chain maintenance,
538 pre-cooking, and cooking can also reduce HIS development.

539 According to the study conducted by Pacoma and Yap-Dejeto entitled “Health
540 Risk Assessment: Total Mercury in Canned Tuna and in Yellowfin and Frigate
541 Tuna Caught from Leyte Gulf and Philippine Sea”, examines mercury contamina-
542 tion in both canned and locally caught tuna in the Philippines. Methylmercury,
543 a potent neurotoxin, presents risks especially to vulnerable groups like pregnant
544 women and children. The study reveals that canned tuna generally has higher
545 mercury levels (0.07 µg/g) than locally caught tuna (0.002–0.024 µg/g). Based
546 on the Food and Agriculture Organization’s fish consumption data, the mercury
547 intake from locally caught tuna is within the World Health Organization’s safe
548 limits, whereas canned tuna may exceed these limits for some groups. This high-
549 lights the need for monitoring of the mercury levels in the Philippine tuna supply
550 chain, as tuna is a dietary staple and economic asset in the region, to mitigate
551 health risks from chronic exposure.

552 Risk management is important for tuna supply chains to analyze the root of the
553 risk and to assess the probability of such cases through the information taken from
554 the different locations or sorting states where the tuna product is handled before
555 being purchased by the consumer or end-use state (Parenreng et al, 2016).

556 2.6 Technology of Blockchain

557 According to Zheng et al. (2017), the idea of blockchain was first introduced in
558 2008 and was first implemented in the Bitcoin business which deals with cryp-
559 tocurrencies. This kind of technology tracks transactions and stores it in a list of
560 blocks. According to Sarmah (2018) , it acts as a database of transactions which
561 is overseen and verified by distributed nodes. Blockchain works by linking blocks
562 (where data is stored). When a transaction is initiated, it is then broadcasted to
563 a network of computers that verifies the transaction and if the verification is suc-
564 cessful, it will then be grouped and linked with the previous transactions that will
565 be added to the blockchain (Zheng et al., 2017). It does not require a middleman
566 because it operates on a peer-to-peer transaction. This eliminates the traditional
567 way of a central authority like the bank (Sarmah, 2018).

568 Automated process of transactions is also one of the salient features of blockchain
569 which is executed automatically based on predefined rules involving no third par-
570 ties. These predefined rules are conditions that need to be met in order for the
571 transaction to proceed. Given this, blockchain is described to be a “trust-free
572 technology” since it reduces the number of trusted individuals instead they trust
573 the machine itself which is difficult to manipulate given its cryptographic security
574 (Ali et al., 2023). Blockchain also ensures immutability with its data. Once the
575 data has been added to the blockchain, it is difficult to change since each block has
576 a cryptographic link to other blocks, which guarantees that the data is tamper-
577 proof and permanent (Ali et al., 2023). This also brings back to the essence
578 of blockchain being trustworthy. Immutability and tamper-proof enhances data
579 management. It also helps prevent fraudulent activities especially with finances.

2.7. OPPORTUNITIES OF BLOCKCHAIN TECHNOLOGY FOR SUPPLY CHAIN MANAGEMENT

580 Transparency with transactions is one of the features of blockchain which makes
581 the chances of data being tampered less because it is accessible to anyone on the
582 network (Ali et al., 2023).

583 According to Nasurudeen Ahamed et al. (2020), Blockchain technologies are clas-
584 sified into 3 types: Public Blockchain, Private Blockchain,. Consortium Blockchain.
585 In Public Blockchain, all public peers can join together and have equal rights (for
586 example, read, write, and execute) on the public node. In Private Blockchain,
587 only Authorized Private Peers have access to the network. The access to the node
588 in the private peer is limited to the specific node. In Consortium Blockchain,
589 only the authorized team can access and join this blockchain, and all operations
590 in the node must adhere to the access. Their paper, Sea Food Supply Chain
591 Management Using Blockchain, gave the idea that with the purpose of creating a
592 blockchain-driven application, a public blockchain approach could be appropriate
593 for handling consumer-based information as users can verify non-sensitive data
594 like prices, freshness and availability. While handling sensitive information such
595 as internal works and logistics, a consortium blockchain where authorized users
596 such as fish owners, distributors, manufacturers, etc. can handle the core supply
597 chain operations, like tracking the movement of tuna from catch to market.

598 2.7 Opportunities of Blockchain Technology for 599 Supply Chain Management

600 Supply chain is the term used for understanding the business activities for design-
601 ing, developing, delivering, purchasing, and using a product or service (Hugos,

602 2024). Companies and various industries are heavily relying on supply chains to
603 achieve their business objectives. The purpose of supply chain began to be more
604 significant in the last century as firms discovered that supply chain can be used for
605 competitive advantage instead of just a cost driver as believed in the bygone days
606 (Snyder & Shen, 2019). Following the supply chain paradigm can demonstrate the
607 delivery of a product or service while strongly emphasizing the customer's speci-
608 fications. With the increasing studies conducted and published for supply chain,
609 many companies adopted this practice for the benefit of their longevity, as such
610 the term supply chain management has come into place. The Council of Supply
611 Management Professionals or CSCMP (2024) defines supply chain management
612 as the planning and management of all activities involved in sourcing and pro-
613 curement, conversion, and all logistics management activities; essentially, supply
614 chain management integrates supply and demand management within and across
615 the company. Supply chain management is also involved with the relationship
616 with collaborators and channel partners such as suppliers, intermediaries, third
617 party providers, and customers (CSCMP, 2024) .

618 In the article of Cordova et. al (Cordova et. al, 2021), the role of supply chain man-
619 agement and the growing opportunities for blockchain technology in supply chain
620 management was discussed. According to Cordova (2021), the recent innovation
621 and globalization has given rise to the idea of using a data innovation framework
622 for supply chain management. Technologies such as blockchains and enterprise
623 resource planning (ERP) are among the highly contested platforms for supply
624 chain management to operate in a seamless interaction and distribution with the
625 product while heavily relying on modern technology and innovations. The logistic
626 business of the supply chain market is wide and complex, the distribution and

2.7. OPPORTUNITIES OF BLOCKCHAIN TECHNOLOGY FOR SUPPLY CHAIN MANAGEMENT

flow of products is not a simple job, and it heavily relies on paperwork (Georgiou, 2019; Cordova et. al, 2021). The usage of paperwork for logistic business can be at higher risk for lack of transparency, complex or unreliable tracking, deficiency of information, and possible dispute due to the tendency of paper to disappear or tear down, this can in turn delay the process and delivery of the item/product. With the issues encountered in the supply chain market, businesses, people and enterprises are eyeing toward the application of blockchain technology on supply chain management (Cordova et. al, 2021).

Implementing blockchain innovation in ERP systems and companies that use digital platforms can provide opportunities and contribute greatly for business processes (EOS Costa Rica, 2019 as cited by Cordova et al, 2021). The ability of blockchain technology to append new transactions to an existing block containing data can be thought of as a decentralized ledger (Cole et al, 2019). The method of blockchain to behave like a decentralized ledger can serve as a single unified source of data which in turns create a clear and consistent audit trail involved in the manufacturing, assembly, supply, and maintenance processes. According to Cole et al (2019), blockchains provide data to the movement and relation of products from its origin, inventory, shipment, and purchase. One potential of blockchain for supply chain management (Hackius & Petersen, 2017) is the ease of paperwork processing, specifically in ocean freight. When IBM and Maersk settled for a permissioned blockchain solution, they were able to connect a global network of shippers, carriers, ports, and customs. Another potential of blockchain in SCM is to identify counterfeit products. In the pharmaceutical industry and healthcare setting, blockchain could improve patient safety and hazard through establishing supply chain transparency from manufacturers through wholesale and pharma-

652 cies to the individual patients (Hackius & Petersen, 2017). Using blockchain can
653 make it harder to tamper or alter the products chain of origin with illegal and
654 counterfeit products. Blockchain have the potential to facilitate origin tracking.
655 According to Cordova et al (2021) , blockchain allows organizations to input rel-
656 evant data inside a chain which would have constant updates and tracking, this
657 supports visibility and traceability of the origin of the product. Smart contracts,
658 an executable code and a feature of blockchain, serves as a computer protocol
659 made between participants to digitally facilitate, execute, verify, and enforce an
660 agreement or terms of contract which is then stored in the blockchain (Khan et
661 al, 2021).

662 **2.8 Supply Chain Model with Blockchain Tech- 663 nology of Fishing Industry in Indonesia**

664 Larissa and Parung (2021) who explored the application of blockchain and de-
665 signed a supply chain model based on it, specifically for the Indonesian fishing
666 industry, aimed to mitigate the challenges in the fishery industry such as product
667 quality (perishability), long shipping times ,and data manipulation. The model
668 they developed of using QR codes for each player in the supply chain then tracking
669 it by scanning the QR code, could inspire the approach of this study in building
670 a blockchain-driven application for the tuna supply chain in the Philippines.

671 **2.9 Existing Technology Intended for Traceabil-**

672 **ity and Supply Chain**

673 A study of Shamsuzzoha et al. (2023) discussed the feasibility of implementing
674 a blockchain driven application called ‘Tracey’ for monitoring the fish traceabil-
675 ity in supply chain management. The study utilized the theoretical framework
676 developed by Islam & Cullen (2021) for improving the understanding and effec-
677 tiveness of implementing a food traceability system. The framework consists of
678 four principles as a basis for the supply chain management: identification, data
679 recording, data integration, and accessibility (Islam & Cullen, 2021). The Tracey
680 application utilized a public-private hybrid blockchain-based conceptual frame-
681 work by Mantravadi and Srai (2023) to uphold the transparency, traceability, and
682 certification of the sea food produce, specifically shrimp. The prototype being
683 studied by Shamsuzzoha et al. (2023) called Tracey focuses on the mobile-based
684 solution approach, the study found that the most widely used smartphone type
685 in the Philippines is the android phone which is where the Tracey prototype is
686 intended to be used. The Tracey app allows fishermen to log their catch details
687 and buyers to verify and update transaction history (Shamsuzzoha et al., 2023).
688 The Tracey app uses a central database for storing fish trading data and a decen-
689 tralized ledger or blockchain for traceability purposes. The decentralized ledger
690 acts as a tamper-proof copy of the data recorded by fishermen and buyers. The
691 result of the study finds that fishermen are open to using digital methods for
692 payments and confidentiality which is required for exporting the fish product to
693 maintain high standards for traceability, catch certification, and product quality.
694 The usage of blockchain as exemplified by the Tracey project can be used for

695 upholding the restriction for IUU due to its ability to ensure transparent trade,
696 consistent records, and accessibility. The result and discussion of the study of
697 Shamsuzzoha et al. (2023) provides a solution for improving the sustainability of
698 tuna fishery and ensures that Filipino fishermen receive fair compensation. For
699 the study limitation of the Tracey project, although there is a high acceptabil-
700 ity of potentially using the app for fishermen, there are still constraints in terms
701 of proper incentives, connectivity issues, technology usability, and education for
702 using the app.

703 A study of Cocco and Mannaro (2021) proposed a blockchain-based technology
704 in the traceability of the supply chain management of a traditional Italian food
705 product, Carasau bread, which is made from durum wheat flour, salt, yeast and
706 water. Since the production of this product is traditional, consumers would de-
707 mand for transparency on the methods used in the Carasau bread production to
708 ensure authenticity. The proposed model involves the combination of the appli-
709 cation of Internet of Things (IoT), specifically the Radio Frequency Identification
710 (RFID) sensors and Interplanetary File System (IPFS) with Blockchain (Cocco
711 & Mannaro, 2021). RFID is a technology that uses radio frequencies to identify
712 and track a tagged object while IPFS allows files to be stored and tracked over a
713 decentralized and distributed file system. Cocco and Mannaro (2021) also stated
714 that using RFID tags that will be integrated with different sensors to monitor
715 food quality will be useful in their study. These sensors include freshness indica-
716 tors to monitor the food quality when packaged, biosensors to detect degradation
717 molecules, time temperature indicator to measure and record temperature and
718 humidity sensors to detect the amount of water vapor in the atmosphere. The
719 integration of IoT and blockchain technology can have a huge impact in increasing

720 traceability in agri-food supply chain. Moreover, this study proposed to have a
721 generic agri-food traceability system which will be based on Ethereum blockchain,
722 Radio-frequency identification (RFID), Near Field Communication (NFC), and
723 Interplanetary File System (IPFS) technology. Moreover, the model proposal also
724 includes sensor network devices, smart contacts, optical cameras and an external
725 database. Each IoT device will be connected to Raspberry Pi and interfaces with
726 blockchain implementing smart contracts and IPFS which authorities can inspect
727 every node and batch online through the uploaded files in IFPS; hashes of the
728 uploaded files on IFPS are also stored on blockchain (Cocco & Mannaro, 2021) .
729 In this way, users along the chain supply can view and trace each batch using the
730 NFC tags promoting transparency and traceability. Overall, the proposed model
731 is a combination of two subsystems. The first one is an on-chain system which is
732 the blockchain implementing smart contracts and will be developed using Solidity,
733 an object-oriented language. The second one is an off-chain system that will be
734 implemented in Javascript using Node.js (to interact with the smart contracts)
735 and Web3.js packages (to interact with blockchain) and these packages should be
736 installed on the Raspberry Pi. However, the purpose of this study is to exam-
737 ine the traceability systems of the agri-food industry and further provide possible
738 solutions.

739 **2.10 Developing a Traceability System for Tuna 740 Supply Chains**

741 The study of Kresna et al. (2017), proposed an IT-based traceability system for
742 tuna supply chain as opposed to the traditional paper based traceability system
743 which has several limitations such as the potency to be manipulated, error by
744 the human, language barrier, and physical damage. The architecture comprises
745 several layers: infrastructure, data, application, communication, and user lay-
746 ers. The infrastructure layer includes computer hardware, network infrastructure,
747 and sensing devices like CCTV, GPS, and RFID for data acquisition. The data
748 layer serves as the system's database, featuring both a main system database and
749 an emergency database for critical situations. The application layer consists of
750 various modules—admin, tracing, transporter, supplier, and government—that
751 registered actors can access through different interfaces. Finally, the user layer
752 consists of the registered actors who utilize the system.

753 The journal article of Tiwari (2020) called Application of Blockchain in Agri-
754 Food Supply Chain conducted two case studies for a blockchain driven app built
755 for supply chain related to food, fishing, and agriculture. The first case-study is
756 the usage and effectiveness of the Provenance system for tuna tracking certifica-
757 tion. The objective of the Provenance system is to enhance transparency in the
758 tuna supply chain by ensuring certification and standard compliance across all
759 roles(e.g. supplier, retailer) in the chain. The system is built using six modular
760 programs: registering, standards, production, manufacturing, tagging, and user-
761 interface. The usage of blockchain in the Provenance system allows transactions to
762 be recorded to allow shared ledger for transparency and smart contracts for secure

763 exchanges of money or information. The usage of the Provenance system is to
764 solve the issues encountered in the tuna fishing industry affected by various factors
765 such as illegal, unregulated, unauthorized (IUU) fishing, fraud, and human rights
766 abuses. The solution of the Provenance system is to allow tracking, tracing, and
767 certification of tuna using blockchain. The Provenance system has a smart tag-
768 ging feature that allows fishermen to use SMS for digital assets on the blockchain
769 to track where the fish, in return, all supply chain stakeholders can access the
770 data that was sourced from the SMS. The second case-study is the usage of the
771 IBM Food Trust for transparency in the food supply chain. The IBM Food Trust
772 aims to solve the problems in the food supply chain, specifically in product safety.
773 Locating supply chain items in real-time using identifiers like GTIN or UPC is
774 the primary feature of the IBM Food Trust. The app also provides end-to-end
775 product provenance, real-time location and status, and facilitates rapid product
776 recalls. The IBM Food Trust also provides insights and visibility for the freshness
777 of the product to reduce losses and spoilage. Lastly, the IBM Food Trust provides
778 certifications from the information taken when handling and managing the prod-
779 ucts in the supply chain. The case studies conducted by Tiwari (2020) illustrates
780 the potential of blockchain technology in improving transparency, efficiency, and
781 ethical practices within supply chains.

782 2.11 Chapter Summary

2.11.1 Comparison Table of Related Studies

Study	Technology Used	Focus Area	Application	Key Findings	Limitations
Shamsuzzoha et al. (2023)	Blockchain (hybrid model)	Fish traceability	Mobile app (Tracey) for fishermen and buyers	Demonstrated feasibility for traceability, certification, transparency; high user acceptability among fishermen	Connectivity issues, technology usability, need for proper incentives and education
Cocco & Mannaro (2021)	Blockchain, IoT (RFID, IPFS), NFC, Ethereum	Italian traditional food (Carasau bread)	Agri-food supply chain traceability system	Proposed a model combining IoT and blockchain to enhance traceability and transparency	High complexity; requires integration of multiple technologies (RFID, IPFS, NFC)
Kresna et al. (2017)	IT-based system, RFID, CCTV, GPS	Tuna supply chain	Digital traceability system (IT-based)	Identified weaknesses in traditional paper-based systems; proposed IT layers for comprehensive tracking	Infrastructure requirements (CCTV, GPS, RFID); limited detail on blockchain
Tiwari (2020) - Provenance	Blockchain, smart contracts, SMS	Tuna tracking certification	Provenance system for tuna supply chain	Enhanced transparency, certification compliance; addressed IUU fishing, fraud, human rights abuses	Limited to specific regions and roles within supply chain
Tiwari (2020) - IBM Food Trust	Blockchain, GTIN/UPC identifiers	Food supply chain	Real-time tracking, product recalls	Improved transparency, efficiency; enabled real-time status, freshness insights	Focused on general food products; high dependency on IBM ecosystem

Table 2.1: Comparison of Studies on Technology for Traceability and Supply Chain Management

783 2.11.2 Research Gaps and Problem

784 Given the advanced existing technologies in blockchain-based traceability systems
 785 for agri-food supply chains, significant gaps remain in understanding the user ex-
 786 perience and integration challenges faced by the fishermen. While the study by
 787 Shamsuzzoha et al. (2023) highlighted the feasibility and benefits of the mobile
 788 application, Tracey, they overlooked possible issues related to technology adop-

⁷⁸⁹ tion, digital literacy, and connectivity.

⁷⁹⁰ Furthermore, existing technologies have primarily focused on large-scale imple-
⁷⁹¹ mentations and theoretical frameworks without adequately considering the prac-
⁷⁹² tical implications and user experience needed for effective system integration. This
⁷⁹³ study aims to address these gaps by exploring real-world challenges faced by users,
⁷⁹⁴ especially fishermen, in adopting blockchain technology for traceability.

⁷⁹⁵ 2.11.3 Summary

⁷⁹⁶ The literature reviewed highlighted the critical challenges and opportunities re-
⁷⁹⁷ garding the tuna supply chain, particularly in the areas of traceability and sustain-
⁷⁹⁸ ability. Existing supply chain technologies, especially those utilizing blockchain,
⁷⁹⁹ present solutions but also come with limitations in terms of blockchain adoption.
⁸⁰⁰ The application of blockchain technology in the tuna supply chain has shown po-
⁸⁰¹ tential for enhancing traceability from ocean to consumer.

⁸⁰² Through this paper, a blockchain-driven solution could contribute to providing a
⁸⁰³ more efficient and transparent supply chain. However, further studies are neces-
⁸⁰⁴ sary to assess the long-term sustainability of blockchain in such systems.

⁸⁰⁵ **Chapter 3**

⁸⁰⁶ **Research Methodology**

⁸⁰⁷ This chapter outlines a clear and detailed description of the research methods and
⁸⁰⁸ processes used in the development and evaluation of SeaXChange: A Blockchain
⁸⁰⁹ Driven App for Tuna Supply Chain Management. The algorithms, systems, theo-
⁸¹⁰ ries, framework and models are described in detail in which this chapter establishes
⁸¹¹ the foundation of this study .This chapter also explains the data collection method
⁸¹² used ensuring the validity and reliability of the results.In addition, the chapter
⁸¹³ discusses the considerations and potential limitations of this study. Overall, this
⁸¹⁴ will serve as a guide for the readers in understanding the structured process of
⁸¹⁵ developing the SeaXChange.

⁸¹⁶ **3.1 Software Development**

⁸¹⁷ Scrum is a framework within the Agile development that prioritizes flexibility.
⁸¹⁸ It is an iterative software development approach that lets a project be broken

819 down into phases and emphasizes continuous improvements. For this study, the
820 researchers opted to use Scrum because it involved many stakeholders and it
821 operated in a ever-changing environment. Scrum allowed the team to adapt to
822 new requirements through structured sprint planning, weekly reports, and sprint
823 reviews, ensuring continuous alignment with project goals.

824 **3.2 Research Activities**

825 For this study, the researchers opted for interviews because it enabled in-depth
826 exploration of stakeholder perspectives and experiences. The identified fisher and
827 supplier client interface was tested within the perimeters of Barangay Sapa, Mi-
828 agao, Iloilo, Philippines. The identified retailer testers were the vendors who
829 reside in Barangay Mat-y and Barangay Sapa in Miagao. The identified con-
830 sumer testers were situated in Miagao. The specific choice of these stakeholders
831 and locations within Miagao was made to align with the study's defined scope,
832 which concentrates on applying blockchain technology to enhance traceability and
833 transparency within the small-scale tuna supply chain and localized market in the
834 specified barangay of Miagao, Iloilo. This focus includes examining the trace-
835 ability of whole, small-sized caught tuna products from capture through the local
836 supply chain to consumers within this area. This localized approach facilitated a
837 practical assessment of the SeaXChange application's potential effectiveness and
838 user experience within a specific operational context.

839 3.2.1 Feedback Collection Method

840 The feedback was collected through a combination of structured interviews and
841 assessment forms. Participants were asked to complete an assessment rubric evalu-
842 ating the SeaXChange app across key criteria such as functionality, end-user needs,
843 performance, usability, ease of use and feasibility. Moreover, follow-up interviews
844 were conducted to gather deeper qualitative insights and obtain suggestions for
845 system improvement.

846 The feedback gathered from fishermen, suppliers and retailers, and consumers
847 was analyzed based on the SeaXChange assessment rubric, which evaluated six
848 major categories: Functionality, End-user Needs, Performance, Usability, Ease of
849 Use and Feasibility. The collected data were analyzed using descriptive statistics,
850 through the computation of mean scores for each assessment criterion. These
851 mean values were used to summarize stakeholder perceptions of the system. Mean
852 ratings were calculated based on the 1-5 Likert Scale where 1 = Poor and 5 =
853 Very Good.

854 3.2.2 Data Gathering**855 • Primary Data:**

- 856 – Stakeholder(Fishermen, Supplier, Retailers, and Consumers) interviews
857 were conducted to identify the use-case and user requirements, interface
858 usability, and adoption challenges.
- 859 – Observations were made of existing tuna supply chain processes in local
860 settings.

861 • Secondary Data:

- 862 – Literature review was conducted on blockchain applications in supply
863 chain management and product traceability.
- 864 – Industry reports and regulatory documents related to tuna fishing and
865 supply chain operations.

866 **3.2.3 Designing and Developing the System**

867 1. **Software Development Methodology:** The project followed a Scrum
868 framework to ensure continuous iteration, stakeholder involvement, and flex-
869 ibility in adapting to feedback.

870 2. **Technology Stack:**

- 871 • Front-end Development: Used React for creating a secure and user-
872 friendly interface for stakeholders, prioritizing simple and responsive
873 user-interface.
- 874 • Back-end Development: Used Node.js along with Express for managing
875 back-end processes and API integration. Express is a flexible web applica-
876 tion framework for Node.js used to build APIs for web applications.
877 Docker for containerization of the project and Windows Subsystem for
878 Linux (Ubuntu as the Linux distribution) for setting up the network.
- 879 • Cloud Infrastructure: Used Google Cloud to host backend services and
880 manage the databases, where the app could be accessed globally. It
881 also ensured the app could scale smoothly as more data and users were
882 added.

- 883 • Blockchain Framework: Used Go language for developing smart con-
884 tracts and providing an immutable ledger for transaction data.
- 885 • Database for Accounts: Used Firebase managing user accounts and
886 authentication.

887 **3. Blockchain Development Platform:**

- 888 • Used Hyperledger Fabric for its permissioned nature and scalable ar-
889 chitecture.
- 890 • The open-sourced resources and timely updates of Hyperledger Fabric
891 components is ideal for creating a distributed ledger for tuna supply
892 chain.

893 **3.2.4 Implementing Algorithms and Services**

894 The system for this study is built on top of a Hyperledger Fabric project, it also
895 utilized combinations of algorithms to facilitate the work flow of data or asset
896 as well as ensuring high security with encryption and decryption configuration
897 techniques.

898 **1. Consensus Algorithm**

899 The project followed Raft(Leader-based consensus) for handling organiza-
900 tions or nodes. Raft is intended for managing a replicated log in a blockchain
901 network. Raft is a Crash Fault Tolerant (CFT) protocol, is designed to han-
902 dle non-malicious node failures (e.g., hardware crashes, network issues) In
903 Raft, one node is elected as the leader, and it coordinates the ordering of

904 transactions (Xu et al, 2022) . The leader replicates log entries (transactions)
905 to follower nodes, ensuring consistency across the network.

906 **2. Cryptographic Algorithm**

907 The project employed several cryptographic algorithms to ensure security
908 and privacy. These cryptographic data served as digital signatures and iden-
909 tity verification for the project. ECDSA (Elliptic Curve Digital Signature
910 Algorithm) was used for generating digital signatures while X.509 certifi-
911 cates are intended for identity management and authentication of partic-
912 ipants (Anitha & Sankarasubramanian, n.d.) . For the encryption, AES
913 (Advanced Encryption Standard) was used for encrypting data at rest and
914 in transit. TLS (Transport Layer Security) secured communication between
915 network nodes. SHA-256 (Secure Hash Algorithm-256) ensured data in-
916 tegrity by generating unique hashes for blocks and transactions.

917 **3. Membership Service**

918 The implementation of the Membership Service Provider (MSP) requirement
919 involved a set of folders added to the network configuration. These folders
920 defined an organization both internally, by specifying its administrators,
921 and externally, by enabling other organizations to verify the authority of
922 entities attempting specific actions. While Certificate Authorities (CAs)
923 are responsible for generating the certificates that represent identities, the
924 MSP included a list of permitted identities. The MSP specified which Root
925 CAs and Intermediate CAs are authorized to define members of a trust
926 domain. This was achieved by either listing the identities of their members
927 or identifying the CAs allowed to issue valid identities for those members.

928 **4. Ordering Service**

929 The ordering service in this study played a crucial role in maintaining the
930 integrity and functionality of the blockchain network. Its primary responsi-
931 bilities included ensuring that transactions are processed in the correct
932 sequence (transaction ordering), grouping transactions into blocks based on
933 configurable parameters like size or timeout (block creation), and distribut-
934 ing these ordered blocks to peers for validation and commitment (block
935 distribution) (Nassar et al, 2024). Additionally, the ordering service pro-
936 vided fault tolerance to ensure the network remains operational even in the
937 presence of node failures through Raft.

938 **5. Endorsement Policy**

939 Fabric employs endorsement policies to specify which peers must validate a
940 transaction before it's committed. The algorithm involved multi-signature
941 schemes where a transaction is valid if it receives endorsements from the
942 required peers as per the policy.

943 **6. Chaincode (Smart Contract)**

944 The handling and flow of business logic agreed to by members of the tuna
945 supply chain in the blockchain network is executed by a chaincode or smart
946 contract. The chaincode of the app was written in Go language. Docker
947 container was used for enabling the chaincode to securely run along with the
948 overall hyperledger fabric configurations. Chaincode initializes and manages
949 ledger state through transactions submitted by applications (Hyperledger
950 Fabric Documentation, 2024) . The chaincode followed the object-oriented
951 paradigm for creating classes and objects necessary for the tuna supply
952 chain.

953 3.2.5 Modeling the System Architecture

954 The system architecture of the project were consisted of many nodes that com-
955 municated with each other. The chaincode enabled the system to run algorithms,
956 particularly, holding state and ledger data, and executes transactions such as asset
957 transfer in the tuna supply chain.

958 • **Blockchain Architecture**

959 The project involved peer, ordering services, ledger, and client application
960 to perform various transaction such as tracing the origin and the stop points
961 of a tuna asset. Peers are nodes in the blockchain network that maintained
962 a copy of the distributed ledger and execute chaincode (smart contracts).
963 The ordering service is the central component of the blockchain for ordering
964 transactions and creating blocks to distribute to peers through consensus
965 mechanism. The ledger is the immutable record of all transaction in the
966 tuna supply chain network, stored across all peers. The client application is
967 the interface through which users or tuna supply chain participants interact
968 with the blockchain network.

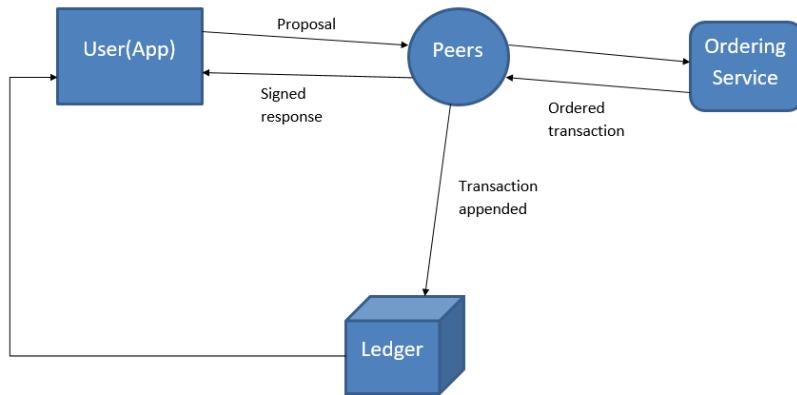

Figure 3.1: Blockchain Architecture of SeaXChange

969 • **Overall System Architecture**

970 The overall system architecture contains a web application built with Next.js
 971 for the frontend, utilizing Firebase for user authentication and account man-
 972 agement. The application follows a role-based access model (Fisher, Sup-
 973 plier, Retailer, Consumer) where each role has specific permissions for inter-
 974 acting with tuna assets in the supply chain. The backend runs on Google
 975 Cloud Platform, consisting of an Express.js API that interfaces with a Hy-
 976 perledger Fabric blockchain network (containerized in Docker) which stores
 977 and manages the immutable record of tuna assets and their transfers be-
 978 tween supply chain participants. This architecture enables secure tracking
 979 of tuna from creation by fishers through the supply chain to consumers,
 980 with appropriate viewing and transfer capabilities assigned to each role in
 981 the process.

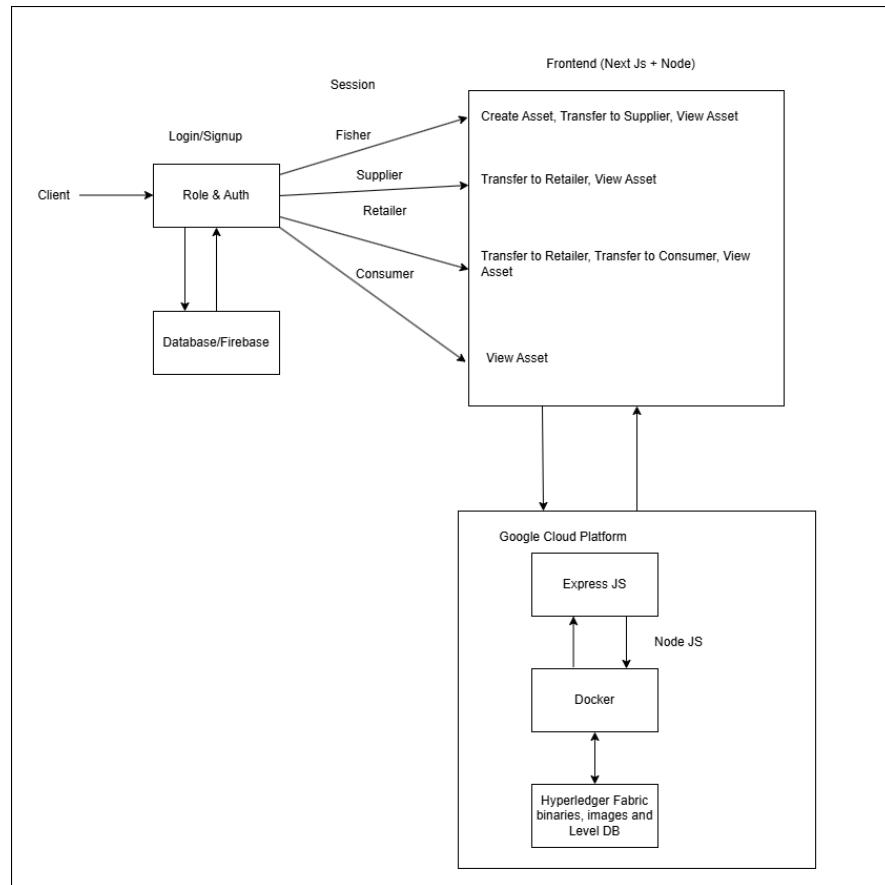

Figure 3.2: Overall System Architecture of SeaXChange

982 • **Use Case**

983 The use case shows the outline on how the user will interact with the SeaX-
 984 Change App. It followed the major stages or participants in the tuna supply
 985 chain.

986 1. **Fisher**

- 987 - Encodes tuna I.D. of fish.
 988 - Encodes the date when the fish was captured.
 989 - Encodes the location where the fish was captured.
 990 - Encodes the fishing method used.

991 - Query the origin and exchange of the tuna asset.

992 **2. Supplier**

993 - Encodes when the product was transferred from fisher to supplier.

994 - Query the origin and exchange of the tuna asset.

995 - Generate supplier's location during retrieval of tuna asset.

996 **3. Retailer**

997 - Encodes when the product was retrieved from the supplier or another
998 retailer.

999 - Query the origin and exchange of the tuna asset.

1000 - Generate retailer's location during retrieval of tuna asset.

1001 **4. Consumer**

1002 - Retrieve data from retailer.

1003 - Query the origin and exchange of the tuna asset.

1004 There are four (4) types of users that will use the app. The first user
1005 type is the Fisher, which will be the starting point of the blockchain.

1006 It will encode the catch details of a tuna product such as the date of
1007 capture, location, and fishing method. The second user type is the
1008 Supplier, which will encode when the product was transferred from
1009 the fisher to the supplier, as well as generate their location during
1010 the retrieval of the tuna asset. The third type is the Retailer, which
1011 will encode when the product was transferred from the supplier to the
1012 retailer or in the case of multiple retailers, from the previous retailer to
1013 the current retailer, their location is also generated during the retrieval
1014 of the tuna asset. Lastly, the Consumers, which can only query the
1015 origin and exchange of tuna assets.

Figure 3.3: Use case diagram for SeaXChange.

¹⁰¹⁶ **Chapter 4**

¹⁰¹⁷ **Results and Discussions**

¹⁰¹⁸ **4.1 Overview**

¹⁰¹⁹ This chapter presents the results of the system. Included in this chapter are
¹⁰²⁰ screenshots and the discussion of results. The tuna supply chain management
¹⁰²¹ smart contract on Hyperledger Fabric has been initiated and tested within a con-
¹⁰²² trolled blockchain environment. Results indicated that the system was function-
¹⁰²³ ally robust and reliable, having managed assets, transaction integrity, and the
¹⁰²⁴ ability to query and update the ledger in the blockchain. This chapter presents
¹⁰²⁵ the details of the major steps executed during the process, results for those steps,
¹⁰²⁶ and the current status of the system's operations.

1027 **4.2 Smart Contract Deployment and Installation**

1028

1029 **4.2.1 Hyperledger Fabric Prerequisites**

1030 Before executing a smart contract framework and blockchain system, it is cru-
1031 cial to first install and set up the necessary tools and technologies. This includes
1032 setting up Hyperledger Fabric, which involves installing the Fabric binaries, con-
1033 figuring the network, and ensuring all necessary dependencies like Docker, Docker
1034 Compose, and Node.js are installed and properly configured. Additionally, setting
1035 up the required certificates, defining the channel configurations, and ensuring that
1036 peer nodes and orderers are correctly connected and synchronized are all essential
1037 steps in preparing the environment for blockchain and smart contract operations.

1038 • **Software Requirements:**

- 1039 – **Docker and Docker Compose:** Hyperledger Fabric needs to have
1040 Docker installed and running on the system. Docker is required to run
1041 the peer and ordering services of the blockchain system.
- 1042 – **Node.js:** Required for the Fabric SDK for client application integra-
1043 tion with JavaScript libraries such as react.
- 1044 – **Go:** Ensure Go is installed, and the GOPATH environment variable
1045 is set up. This is essential for building and running chaincode(smart
1046 contract) written in Go.
- 1047 – **Fabric Samples:** Clone the official Hyperledger Fabric's fabric-samples
1048 repository from GitHub:

```
1049      git clone -b release-2.4 --single-branch  
1050      https://github.com/hyperledger/fabric-samples  
1051      cd fabric-samples/test-network  
1052
```

1053 – **Binaries and Docker Images:**

```
1054 curl -sSL https://bit.ly/2ysbOFE | bash -s
```

```
1055
```

1056 • **Network Setup:**

```
1057 – Run the test-network script to start the Hyperledger Fabric test net-  
1058 work:
```

```
1059 ./network.sh up
```

```
1060
```

1061 This script starts a peer, an ordering service, and a CA (Certificate
1062 Authority) on the local machine.

```
1063 – After starting the network to docker in the same directory (test-network),  
1064 a channel must be created:
```

```
1065 ./network.sh createChannel
```

```
1066
```

1067 • **Deploying Chaincode (Smart Contract):**

```
1068 – Step 1:
```

```
1069 export PATH=${PWD}/../bin:$PATH
```

```
1070
```

1071 – Step 2:

1072 export FABRIC_CFG_PATH=\$PWD/./config/

1073

1074 – Step 3:

1075 export CORE_PEER_TLS_ENABLED=true

1076 export CORE_PEER_LOCALMSPID="Org1MSP"

1077 export CORE_PEER_TLS_ROOTCERT_FILE=\${PWD}/organizations

1078 /peerOrganizations/org1.example.com/peers/peer0.org1.example.com

1079 /tls/ca.crt

1080 export CORE_PEER_MSPCONFIGPATH=\${PWD}/organizations

1081 /peerOrganizations/org1.example.com/users

1082 /Admin@org1.example.com/msp

1083 export CORE_PEER_ADDRESS=localhost:7051

1084

1085

1086 4.2.2 Invoking the Blockchain System

1087 After setting up the prerequisites, including Docker containers, the test network,

1088 and chaincode, the tuna supply chain system can now be invoked for creating,

1089 transferring, and querying tuna assets. The figures provided below demonstrate

1090 the processes involved in invoking the blockchain system.

4.2. SMART CONTRACT DEPLOYMENT AND INSTALLATION

45

```
[root@ryrex2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]# peer chaincode query -C mychannel -n basic_cc -f "queryAllAssets"
[{"ID": "tuna1", "Species": "Skipjack", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-01", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierX", "Retailer": "Reyes"}, {"ID": "tuna2", "Species": "Yellowfin", "Weight": 8.5, "CatchLocation": "Palawan", "CatchDate": "2024-12-02", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierY", "Retailer": "Cruz"}, {"ID": "tuna3", "Species": "Bluefin", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-03", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierZ", "Retailer": "Cruz"}, {"ID": "tuna4", "Species": "Skipjack", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-04", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierX", "Retailer": "MA"}, {"ID": "tuna5", "Species": "Albacore", "Weight": 6, "CatchLocation": "Davao", "CatchDate": "2024-12-05", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierA", "Retailer": "MA"}, {"ID": "tuna6", "Species": "Skipjack", "Weight": 6, "CatchLocation": "Davao", "CatchDate": "2024-12-06", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierB", "Retailer": "MA"}]
[ryrex2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]
```

Figure 4.1: Query Smart Contract: Check assets

1091 • Adding new tuna assets:

1092 Here, a new tuna asset is created and registered on the blockchain. This in-
 1093 volves invoking the smart contract to add a new entry, which includes details
 1094 such as the type of tuna, quantity, and any other relevant information. This
 1095 step ensures that newly caught or acquired tuna can be tracked throughout
 1096 the supply chain.

```
[root@ryrex2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]# peer chaincode invoke -o localhost:7050 --ordererTLSHostnameOverride orderer.example.com --tlsRootCertFile $PWD/organizations/ordererOrganizations/example.com/msp/tlscacerts/tlscacert.pem -C mychannel -n basic_cc -c '{"function": "CreateAsset", "Args": [{"ID": "tuna7", "Species": "Skipjack", "Weight": 6, "CatchLocation": "Antique", "CatchDate": "2024-12-07", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierX", "Retailer": "MA"}]} >>> Chaincode invoke successful. result: status:200
[ryrex2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]
```

Figure 4.2: Invoke Smart Contract: Create/Add new tuna asset

1097 • Check all assets after adding a new tuna asset:

1098 After adding a new tuna asset, the smart contract is queried again to verify
 1099 that the asset has been successfully added. This step confirms that the new
 1100 asset is part of the current inventory and that no discrepancies exist in the
 1101 recorded data.

```
[root@ryrex2002@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/fabric-samples/test-network]# peer chaincode query -C mychannel -n basic_cc -f "queryAllAssets"
[{"ID": "tuna1", "Species": "Skipjack", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-01", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierX", "Retailer": "Reyes"}, {"ID": "tuna2", "Species": "Yellowfin", "Weight": 8.5, "CatchLocation": "Palawan", "CatchDate": "2024-12-02", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierY", "Retailer": "Cruz"}, {"ID": "tuna3", "Species": "Bluefin", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-03", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierZ", "Retailer": "Cruz"}, {"ID": "tuna4", "Species": "Skipjack", "Weight": 5.5, "CatchLocation": "Antique", "CatchDate": "2024-12-04", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierX", "Retailer": "MA"}, {"ID": "tuna5", "Species": "Albacore", "Weight": 6, "CatchLocation": "Davao", "CatchDate": "2024-12-05", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierA", "Retailer": "MA"}, {"ID": "tuna6", "Species": "Skipjack", "Weight": 6, "CatchLocation": "Davao", "CatchDate": "2024-12-06", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierB", "Retailer": "MA"}, {"ID": "tuna7", "Species": "Skipjack", "Weight": 6, "CatchLocation": "Davao", "CatchDate": "2024-12-07", "FishingMethod": "Longline", "Vessel": "Jagnew", "Supplier": "SupplierC", "Retailer": "MA"}]
```

Figure 4.3: Query Smart Contract: Check assets with new tuna asset

1102 • Transfer tuna asset to Supplier:

1103 This step involves transferring ownership of a tuna asset from the current

holder (e.g., a fisherman or a trader) to a supplier. The smart contract is invoked to facilitate the transfer, ensuring that the transaction is securely recorded on the blockchain and that the asset's new owner is updated accordingly.

Figure 4.4: Invoke Smart Contract: Transfer asset to a supplier

- Check the updated tuna asset:

After the transfer, the smart contract is queried once more to check if the asset details have been updated correctly. This step verifies that the asset's new owner is now the supplier and that all relevant information is correctly updated on the blockchain.

Figure 4.5: Query Smart Contract: Check asset after transfer

- Transfer tuna asset to Retailer:

Similar to the supplier transfer, this step involves transferring the tuna asset from the supplier to a retailer. The smart contract facilitates this transfer, ensuring that ownership is correctly updated and that the retailer has control over the tuna asset. This step is crucial for the supply chain as it moves the tuna from bulk supply to retail.

```
{"ID": "tuna6", "Species": "Skipjack", "Weight": 6, "CatchLocation": "2024-12-05", "CatchDate": "Antique", "FishingMethod": "Longline", "Vessel": "Jaggee", "Supplier": "SupplierA", "Retailer": "RetailerB", "Status": "In Stock", "Category": "Tuna", "SubCategory": "Skipjack", "Image": "https://example.com/tuna6.jpg", "Description": "A large, healthy skipjack tuna, caught using longline fishing methods. ```

4.3. BACKEND SECURITY ANALYSIS (HYPERLEDGER FABRIC ON GCP)47

1119 • **Check the updated tuna asset:**

1120 After the transfer to the retailer, another query is made to verify the updated
1121 asset details. This step ensures that the transaction was successful and that
1122 the retailer now has ownership of the tuna asset. It confirms that the asset
1123 has moved through the supply chain correctly.

```
zyrex2082@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/Fabric-samples/test-network$ peer chaincode query -C mychannel -n basic -c '{"Args":["ReadAsset","tuna6"]}'  
[{"ID": "tuna6", "Species": "Skipjack", "Weight": 6.5, "CatchLocation": "Antique", "CatchRate": "200-12-01", "FishingMethod": "Longline", "Vessel": "Jagnee", "Supplier": "SupplierA", "Retailer": "Jose"}]  
zyrex2082@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/Fabric-samples/test-network$
```

Figure 4.7: Query Smart Contract: Check asset after transfer

1124 • **Query Smart Contract and check updated assets:**

1125 The final step involves querying the smart contract to get a complete overview
1126 of all the assets in the supply chain. This includes all tuna assets from fishing
1127 to retail, allowing stakeholders to monitor and manage inventory effectively.
1128 It provides traceability in the supply chain, helping to maintain freshness
1129 and authenticity of the tuna as it moves through the market.

```
zyrex2082@LAPTOP-Q93UQUB8:/mnt/c/SpecialProblem/hyperledger-fabric3/Fabric-samples/test-network$ peer chaincode query -C mychannel -n basic -c '{"Args":["GetAllAssets"]}'

Figure 4.8: Query Smart Contract: Check updated assets

₁₁₃₀ **4.3 Backend Security Analysis (Hyperledger Fab-**

₁₁₃₁ **ric on GCP)**

₁₁₃₂ **4.3.1 System Architecture and Deployment Overview**

₁₁₃₃ The backend of the system's tuna assets was developed using a containerized
₁₁₃₄ Hyperledger Fabric deployed on Google Cloud Platform (GCP). The network of
₁₁₃₅ Hyperledger Fabric consists of a peer node, an ordering node, and Certificate
₁₁₃₆ Authorities (CAs).

₁₁₃₇ **4.3.2 Blockchain Network Security**

₁₁₃₈ The blockchain network leverages Hyperledger Fabric's security model to ensure
₁₁₃₉ authenticated transactions and controlled access. A Membership Service Provider
₁₁₄₀ (MSP) manages identities and issues certificates based on a Public Key Infrastruc-
₁₁₄₁ ture (PKI) model, ensuring that only verified participants can interact with the
₁₁₄₂ network.

₁₁₄₃ Key security features include:

₁₁₄₄ **Channel Privacy**

₁₁₄₅ Channels act as private communication subnets, isolating transaction data so that
₁₁₄₆ only authorized organizations can access and process specific transactions.

4.3. BACKEND SECURITY ANALYSIS (HYPERLEDGER FABRIC ON GCP)49

1147 Policies and Access Control

1148 Policies, including endorsement policies and access control lists (ACLs), govern
1149 how transactions are validated, how channel resources are accessed, and how
1150 changes to the network are approved. Endorsement policies specifically define
1151 which peer nodes must approve a transaction before it is committed to the ledger.

1152 Secure Communication

1153 Transport Layer Security (TLS) is enforced across node communications to protect
1154 data in transit. Mutual TLS is used for operational endpoints like monitoring
1155 services.

1156 Identity and Role Management

1157 Every network participant—peer nodes, orderer nodes, client applications (SeaX-
1158 Change Web Application)—has a cryptographically verifiable identity, with roles
1159 defined within the framework to control access and permissions within channels.

1160 Hardware Security Modules (HSMs)

1161 Critical cryptographic operations, such as signing transactions under the blockchain
1162 assets invocation, can optionally be handled by HSMs to secure private keys out-
1163 side of the software environment.

1164 These layered mechanisms collectively ensure the confidentiality, integrity, and

1165 authenticity of transactions in the blockchain network.

1166 4.3.3 Smart Contract Automated Test Result

1167 To validate the security and functionality of the deployed smart contracts on the
1168 Hyperledger Fabric network, an automated testing script (app.js) under asset-
1169 transfer-basic directory was executed. The script interacted with the blockchain
1170 network through the gateway application, utilizing the defined channel (mychan-
1171 nel) and chaincode (basic). The automated tests performed the following opera-
1172 tions:

1173 InitLedger Transaction

1174 The ledger was initialized by creating a predefined set of tuna asset entries. The
1175 transaction was successfully committed, confirming the proper initialization of
1176 asset data. (See Figure 4.9 for initialization confirmation.)

```
cd /opt/gopath/src/github.com/SpecialProblem/hyperledger-fabric-samples/asset-transfer-basic/application-gateway/javascript/src; node app.js
channelName: mychannel
chaincodeName: basic

  }
]
--> Submit Transaction: UpdateAsset asset70, asset70 does not exist and should return an error
*** Successfully caught the error: Asset asset70 does not exist.
```

Figure 4.10: Initialization Confirmation of the Ledger

1182 CreateAsset Transaction

1183 A new asset was successfully created and appended to the blockchain. The trans-
1184 action was committed without errors, validating the chaincode's ability to handle
1185 new data insertion.

1186 TransferAsset Transaction

1187 Ownership transfer of an existing asset was simulated. The transaction was suc-
1188 cessfully submitted and committed, demonstrating the correct application of asset

1189 updates in the blockchain ledger.

1190 **ReadAsset Query**

1191 The updated asset was retrieved and verified to ensure the correctness of the
1192 transfer. The retrieved asset data reflected the changes made through the previous
1193 transaction, confirming data consistency.

1194 **UpdateAsset Error Handling**

1195 An attempt to update a non-existent asset (asset70) was performed to test the
1196 smart contract's error-handling mechanism. The application correctly caught and
1197 reported the error, verifying that improper transactions are adequately handled
1198 and rejected.

1199 **Summary of Results**

1200 All positive transactions (initialization, creation, transfer, and reading) were suc-
1201 cessfully executed and committed. The smart contract exhibited robust error
1202 handling during invalid operations. Endorsement policies and Membership Ser-
1203 vice Provider (MSP) enforcement ensured transaction authenticity and integrity
1204 during the process. These tests confirm the functional reliability and transac-
1205 tion security of the smart contracts used within the tuna supply chain blockchain
1206 network.

¹²⁰⁷ **4.3.4 GCP Infrastructure Security**

¹²⁰⁸ The Hyperledger Fabric network deployment on Google Cloud Platform (GCP)
¹²⁰⁹ was secured by leveraging multiple layers of Google's infrastructure security model,
¹²¹⁰ following best practices in network, identity, and data protection.

¹²¹¹ **Firewall Rules and Network Control**

¹²¹² Only essential ports (e.g., 7051 for peer communication and 7050 for the ordering
¹²¹³ service) were opened to minimize network exposure. GCP's VPC firewall rules,
¹²¹⁴ ingress and egress controls, and options like VPC Service Controls help further
¹²¹⁵ isolate services and prevent unauthorized access. Traffic between virtual machines
¹²¹⁶ and Google APIs is securely routed through Google's internal network infrastruc-
¹²¹⁷ ture using Private Google Access when available.

¹²¹⁸ **IAM Roles and Access Management**

¹²¹⁹ The principle of least privilege was enforced by assigning minimal permissions to
¹²²⁰ users and services through GCP Identity and Access Management (IAM). Access
¹²²¹ decisions involve authentication, authorization checks, and enforcement of policies
¹²²² through centralized services, helping reduce the risk of unauthorized actions or
¹²²³ privilege escalation.

1224 Encryption

1225 GCP ensures that data is encrypted both at rest and in transit by default. Storage
1226 systems use multiple layers of encryption, with cryptographic keys managed by
1227 Google. For additional control, Cloud Key Management Service (KMS) enables
1228 customers to manage their own encryption keys. Data in transit between services
1229 is protected using Application Layer Transport Security (ALTS), and all external
1230 communication with Google services is encrypted via TLS.

1231 Access Control

1232 Access to virtual machines and services was restricted using secure access methods.
1233 Identity-Aware Proxy (IAP) or VPN connections were employed to safeguard SSH
1234 and administrative access. GCP's zero-trust model emphasizes verifying identity
1235 and device security rather than relying solely on network location, aligning with
1236 best practices for modern infrastructure protection.

1237 Infrastructure and Operational Security

1238 GCP's underlying infrastructure benefits from Google's proprietary hardware de-
1239 signs, including the Titan security chip, secure boot mechanisms, and service iden-
1240 tity enforcement. Google's physical data centers use multi-layered defenses such
1241 as biometrics and intrusion detection systems. Operational security practices, in-
1242 cluding binary authorization and extensive monitoring, reduce insider risks and
1243 enforce software integrity throughout the lifecycle.

₁₂₄₄ By deploying the blockchain network on GCP, the project leveraged a highly se-
₁₂₄₅ cure environment, benefiting from Google's layered security architecture across
₁₂₄₆ networking, identity management, encryption, access control, and operational
₁₂₄₇ practices.

₁₂₄₈ 4.3.5 Threat Model and Mitigations

₁₂₄₉ Potential threats to the system were identified and mitigation strategies were applied, as summarized in Table 4.1.

Threat	Mitigation
Unauthorized access to network	Use of MSP and Certificate Authorities
Tampering with transactions	Endorsement policies and consensus mechanisms
Denial of Service (DoS) attacks	GCP Firewall and rate limiting rules
Data leakage	Private channels and access controls

Table 4.1: Potential Threat and Mitigation

₁₂₅₀

₁₂₅₁ 4.4 Mockups

₁₂₅₂ The mockups represent the preliminary design for the SeaXChange web applica-
₁₂₅₃ tion, created using Figma to facilitate collaboration and incorporate feedback
₁₂₅₄ efficiently. The visual design features a teal-based color scheme to evoke an oceanic
₁₂₅₅ theme, aligning with the app's focus on tuna products supply chain. This aesthetic
₁₂₅₆ choice reinforces the app's identity and enhances user engagement.

₁₂₅₇ Upon launching the app, users are first directed to the Login or Sign-Up page,
₁₂₅₈ where authentication is required to access any data. This ensures security and

1259 role-specific access within the blockchain system.

1260 Once authenticated, users are redirected to their personalized homepages, which
1261 include their profile information and a dashboard showing relevant tuna product
1262 assets. The user experience is role-dependent:

1263 • All users can view available assets on the blockchain.

1264 • Fishermen are the only users who can create new assets, representing newly
1265 caught tuna.

1266 • Suppliers and Retailers have the ability to pass on assets down the supply
1267 chain, updating the product's status, location, or freshness.

1268 This role-based structure ensures traceability, accountability, and clarity across
1269 the supply chain, while maintaining a clean and intuitive interface tailored to
1270 each user type.

¹²⁷¹ 4.5 Operational Flow of the Web Application

¹²⁷² This section will discuss the flow in using the SeaXChange Web Application. It
¹²⁷³ will show the respective interface for every page and how the users can interact
¹²⁷⁴ with it.

¹²⁷⁵ 4.5.1 Landing Page

¹²⁷⁶ Users are be greeted with the landing page, where it shows a ocean visuals and
¹²⁷⁷ a tagline “Discover the Journey your tuna made from the ocean to your dinner
¹²⁷⁸ plate”. Users are given the option to Login, where they are redirected to the login
¹²⁷⁹ page or Get Started, where they are redirected to the sign up page.

Figure 4.12: Landing Page

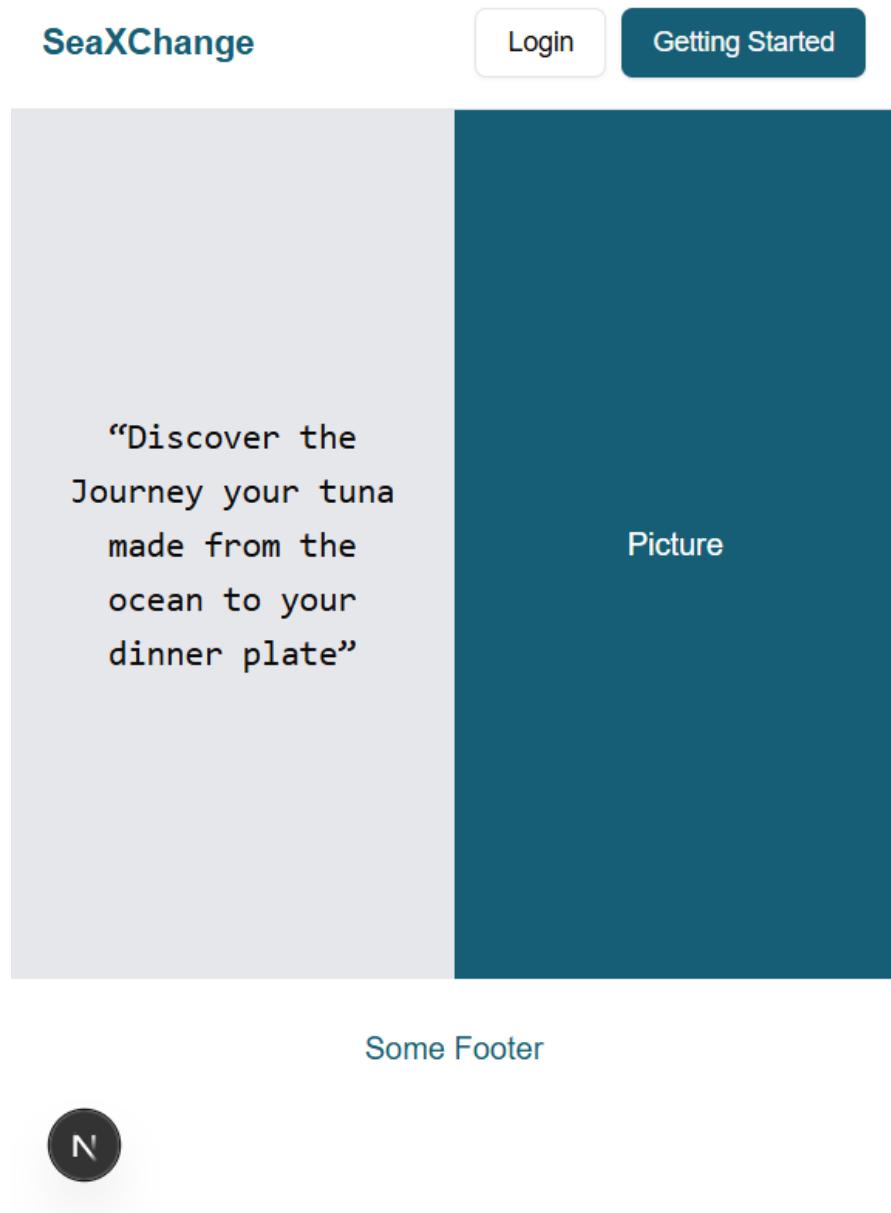

Figure 4.13: Mobile View: Landing Page

1280 **4.5.2 Sign Up Page**

1281 First time users will be required to create an account. They are to provide their
1282 name, email and password. For their user type, there are four roles to choose
1283 from: Fisher, Supplier, Retailer and Consumer.

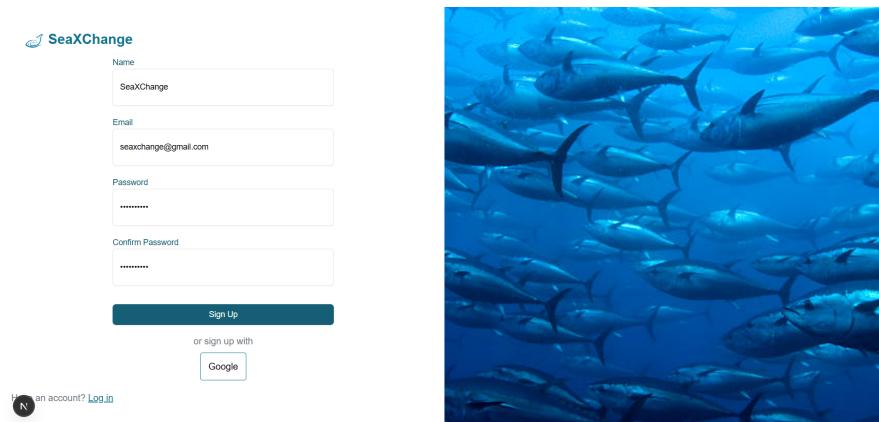

Figure 4.14: SignUp Page

1284 **4.5.3 Login Page**

1285 Returning user are required to login with their email and password.

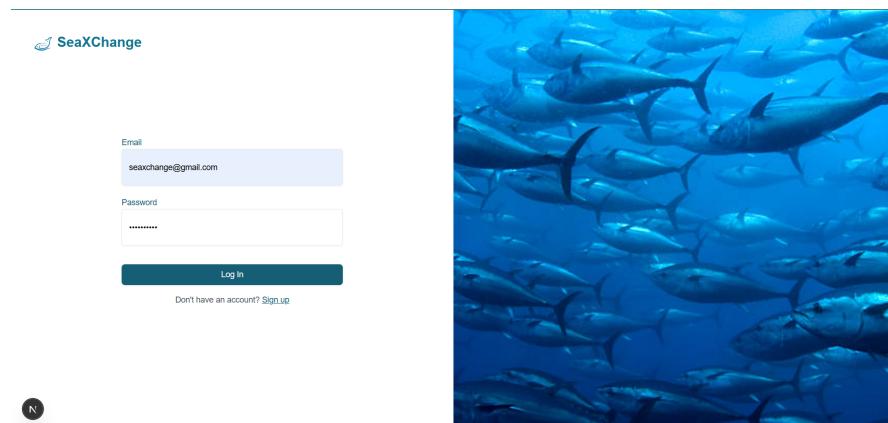

Figure 4.15: LogIn Page

₁₂₈₆ **4.5.4 Homepage**

₁₂₈₇ Each user type has their own respective homepages and features.

- ₁₂₈₈ • **Fisher** Fishers can add a fish catch using the "Add catch" button, where they are to input the species of the fish, weight in kg, catch location, catch date, fishing method used and vessel name. The remaining text fields like the Supplier name, Retailer name and Consumer name are left null and cannot be edited because they will be filled out by the other users receiving the tuna asset. Users can send a tuna asset to the Supplier. Users can also browse existing tuna assets.

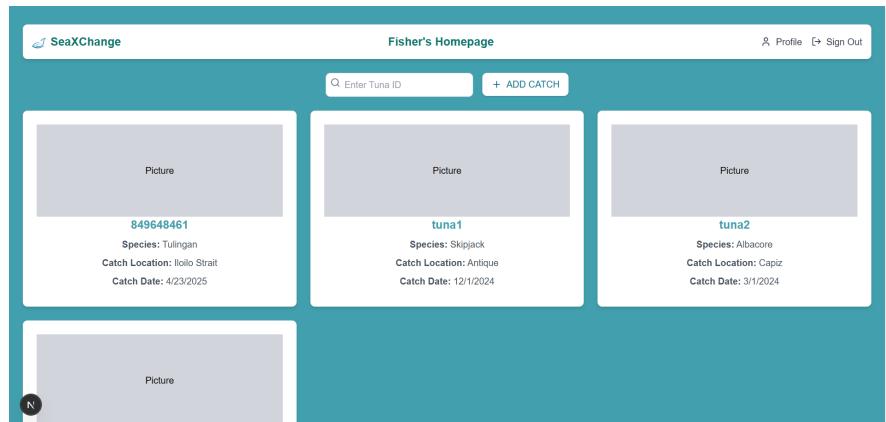

Figure 4.16: Fisher Homepage

- ₁₂₉₅ • **Supplier** Suppliers can browse existing tuna assets. Upon clicking a tuna asset, the user can only edit the Supplier text field. They can send the tuna asset to the Retailer.

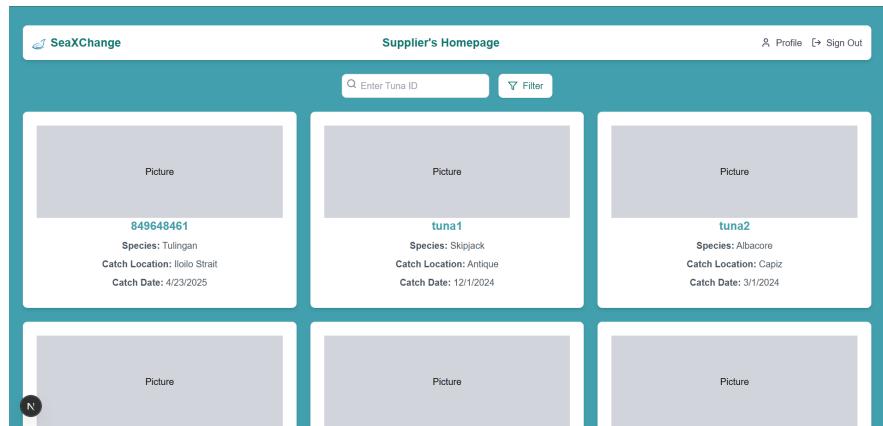

Figure 4.17: Supplier Homepage

- 1298 • **Retailer** Retailers can browse existing tuna assets and can send it to the
1299 Consumer.

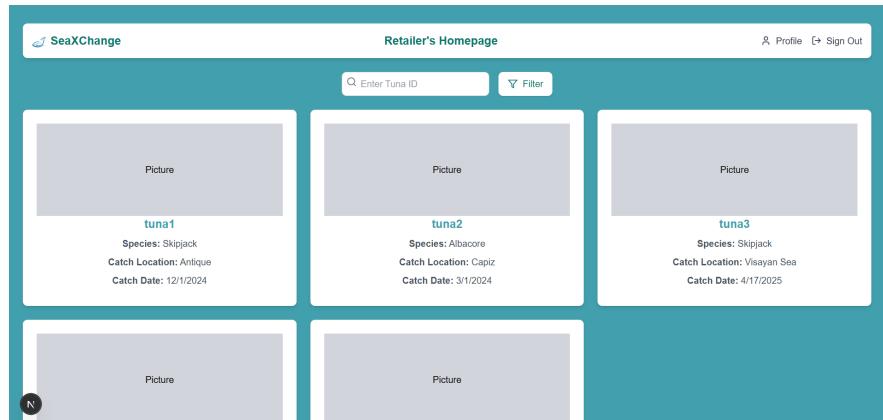

Figure 4.18: Retailer Homepage

- 1300 • **Consumer** Consumers can only view the tuna asset and cannot edit any-
1301 thing else

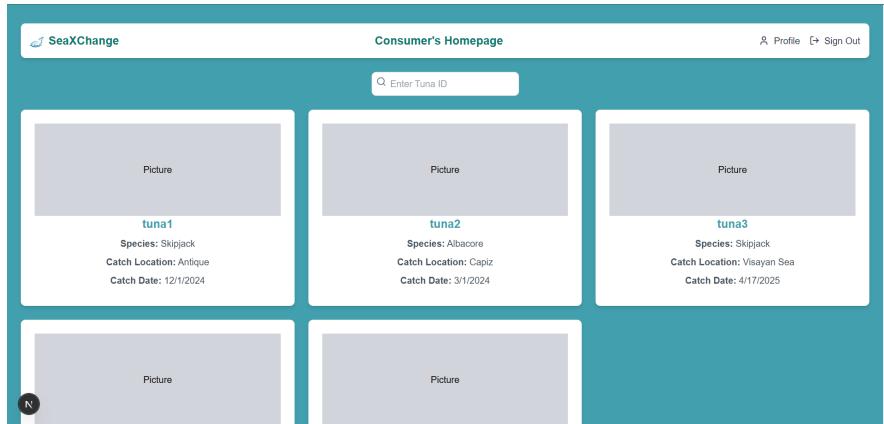

Figure 4.19: Consumer Homepage

1302 4.5.5 Profile

- 1303 The user's profile information is shown on the homepage through a pop-up. It
1304 shows the user's name and role.

1307 4.6 System Discussion

1308 After modifying the Hyperledger Fabric smart contract to assess necessary pro-
1309 cesses involved in the tuna supply chain, the blockchain is ready to be invoked
1310 wherein the smart contract can be activated. To start, a new tuna asset is added
1311 and registered to the blockchain. Each tuna asset has its attributes or details.
1312 Before proceeding to the transfer of tuna asset, the smart contract is queried to
1313 verify if the creation of the asset is successful and if it is part of the current in-
1314 ventory. After that, the tuna asset can be transferred from fisher to supplier and
1315 the asset's owner is updated. The smart contract is queried again to verify if the
1316 asset details have been updated successfully. With the same process, the tuna as-
1317 set is transferred from supplier to retailer using the smart contract and the owner
1318 is updated again. To ensure that the asset details are successfully updated, the
1319 smart contract is queried again. The final step is to query the smart contract to
1320 show the overview of all the assets in the supply chain. With this, it can be seen
1321 all the tuna assets from fishing to retail. Overall, the steps and process provides

¹³²² transparency and traceability in the tuna supply chain.

¹³²³ 4.7 User Demonstration and Feedback Results

¹³²⁴ 4.7.1 Demo Setup and Scenario

¹³²⁵ During the demonstration of the system, the participants had a brief introduction
¹³²⁶ of the key functionalities of the SeaXChange app. They were shown how to
¹³²⁷ create an account, input and send tuna assets from one stakeholder to another.

¹³²⁸ Participants were also shown how real-time updates were reflected on the app.

¹³²⁹ Finally, they were introduced on how to view transaction histories and traceability
¹³³⁰ information on each tuna asset. Throughout the demonstration, participants
¹³³¹ were encouraged to ask questions and provide feedback on the usability and func-
¹³³² tionality of the system. After the demonstration, they were given feedback forms
¹³³³ in order to assess the SeaXChange app.

¹³³⁴ **4.7.2 Summarized Feedback**

Functionality	Stakeholder	Mean	Description
Track assets	Entire Group	3.67	Average
	Fishermen	4.0	Good
	Supplier and Retailers	3.0	Average
	Consumers	4.0	Good
Verify tuna assets	Entire Group	3.67	Average
	Fishermen	3.33	Average
	Supplier and Retailers	4.0	Good
	Consumers	3.67	Average
Support real-time updates	Entire Group	3.56	Average
	Fishermen	3.78	Average
	Supplier and Retailers	4.0	Good
	Consumers	4.0	Good
Enable smart contract execution	Entire Group	3.42	Average
	Fishermen	2.33	Fair
	Supplier and Retailers	3.25	Average
	Consumers	4.67	Good

Table 4.2: Mean ratings and descriptions for functionality-related features per stakeholder group.

¹³³⁵ When taken as a whole, the respondents have average feedback in asset tracking
¹³³⁶ but when classified by stakeholder, the fishermen ($M = 4.0$) and consumers (M
¹³³⁷ $= 4.0$) had good feedback in tracking , while the supplier and retailers have an
¹³³⁸ average rating ($M = 3.0$). For verifying tuna assets, the entire group has an average
¹³³⁹ feedback. When classified by stakeholder, the fishermen ($M = 3.33$) and consumers
¹³⁴⁰ ($M = 3.67$) have average ratings. For real-time updates, the respondents, when
¹³⁴¹ taken as a whole, have an average feedback. When classified by stakeholder, the
¹³⁴² fishermen ($M = 3.78$) have an average rating, while both supplier and retailers (M
¹³⁴³ $= 4.0$) and consumers ($M = 4.0$) have good ratings. For smart contract execution,
¹³⁴⁴ the respondents, when taken as a whole, also have an average feedback. When
¹³⁴⁵ classified according to stakeholder, the fishermen have a fair rating ($M = 2.33$),

- ¹³⁴⁶ the supplier and retailers have average ratings ($M = 3.25$) and the consumers have
¹³⁴⁷ good ratings ($M = 4.67$).

End-user Needs	Stakeholder	Mean	Description
Provide transparency in tracking	Entire Group	3.56	Average
	Fishermen	2.67	Fair
	Supplier and Retailers	4.0	Good
	Consumers	4.0	Good
Provide seamless interaction	Entire Group	3.77	Average
	Fishermen	1.33	Poor
	Supplier and Retailers	3.0	Average
	Consumers	4.0	Good

Table 4.3: Mean ratings and descriptions for end-user needs-related features per stakeholder group.

- ¹³⁴⁸ The respondents, when taken as a whole, had an average feedback in transparency.
¹³⁴⁹ When classified by stakeholder, The fishermen have fair ratings ($M = 2.67$), while
¹³⁵⁰ both supplier and retailers ($M = 4.0$) and consumers ($M = 4.0$) have good ratings.
¹³⁵¹ In evaluating the seamless interaction of the app, the entire group has an average
¹³⁵² feedback ($M = 3.77$). When classified by stakeholder, the fishermen ($M = 1.33$)
¹³⁵³ have poor feedback, the supplier and retailers have average feedback ($M = 3.0$)
¹³⁵⁴ and the consumers have good feedback ($M = 4.0$) in seamless interaction.

Performance	Stakeholder	Mean	Description
Processes transactions efficiently	Entire Group	3.81	Average
	Fishermen	3.67	Average
	Supplier and Retailers	3.75	Average
	Consumers	4.0	Good
Ensures data integrity and security	Entire Group	3.31	Average
	Fishermen	2.67	Fair
	Supplier and Retailers	3.25	Average
	Consumers	4.0	Good

Table 4.4: Mean ratings and descriptions for performance-related features per stakeholder group.

1355 As a whole, the respondents have an average feedback on efficient transactions (M
 1356 = 3.81). If evaluated per stakeholder, both fishermen ($M = 3.67$), supplier and
 1357 retailers ($M = 3.75$) evaluated average while consumers had good feedback ($M =$
 1358 4.0). For data security, the entire group has an average feedback ($M = 3.31$). The
 1359 fishermen have fair evaluation ($M = 2.67$), supplier and retailers ($M = 3.25$) have
 1360 an average and consumers have solid scores ($M = 4.0$).

Usability	Stakeholder	Mean	Description
Provides intuitive interface	Entire Group	3.83	Average
	Fishermen	4.0	Good
	Supplier and Retailers	3.5	Average
	Consumers	4.0	Good
Allows cross-platform accessibility	Entire Group	4.14	Good
	Fishermen	4.0	Good
	Supplier and Retailers	3.75	Average
	Consumers	4.67	Good
Clear, structured, and visually appealing info	Entire Group	3.80	Average
	Fishermen	3.33	Average
	Supplier and Retailers	3.75	Average
	Consumers	4.33	Good

Table 4.5: Mean ratings and descriptions for usability-related features per stakeholder group.

1361 It shows the frequency of intuitive interface among the respondents when taken
 1362 as a whole is average ($M = 3.83$). When classified according to stakeholder,
 1363 both fishermen ($M = 4.0$) and consumers ($M = 4.0$) have good ratings, while the
 1364 supplier and retailers ($M = 3.5$) have average ratings. For cross-platform usage,
 1365 the entire group rated good ($M = 4.14$). When classified according to stakeholder,
 1366 both fishermen ($M = 4.0$) and consumers ($M = 4.1$) also have good ratings, while
 1367 supplier and retailers ($M = 3.75$) have average. For visual clarity, the entire group
 1368 rated average ($M = 3.80$). When classified by each stakeholder, both fishermen
 1369 ($M = 3.33$) and supplier and retailers ($M = 3.75$) have average ratings, while

₁₃₇₀ consumers ($M = 4.33$) have good ratings.

Ease of Use	Stakeholder	Mean	Description
Clear instructions for new users	Entire Group	3.89	Average
	Fishermen	4.0	Good
	Supplier and Retailers	4.0	Good
	Consumers	3.67	Average
Uses clear and simple language	Entire Group	3.31	Average
	Fishermen	4.03	Good
	Supplier and Retailers	3.75	Average
	Consumers	4.33	Good

Table 4.6: Mean ratings and descriptions for ease of use-related features per stakeholder group.

1371 When taken as a whole, the respondents ($M = 3.89$) rated instruction clarity as
 1372 average. When classified by stakeholder, both fishermen ($M = 4.0$) and supplier
 1373 and retailers ($M = 4.0$) have good feedback regarding instruction clarity, while the
 1374 consumers ($M = 3.67$) have average feedback. The entire group rated language
 1375 clarity as average ($M = 3.31$). When evaluated by each stakeholder, both fisher-
 1376 men ($M = 4.03$) and consumers ($M = 4.33$) have good feedback, while supplier
 1377 and retailers ($M = 3.75$) have average feedback.

Feasibility	Stakeholder	Mean	Description
Integration with tuna industry	Entire Group	4.06	Good
	Fishermen	4.0	Good
	Supplier and Retailers	4.5	Good
	Consumers	3.67	Average
Consumer use to track tuna products	Entire Group	4.03	Good
	Fishermen	4.0	Good
	Supplier and Retailers	3.75	Average
	Consumers	4.33	Good

Table 4.7: Mean ratings and descriptions for feasibility-related features per stakeholder group.

1378 When taken as a whole, it shows that the respondents have good feedback in the
 1379 system integration. When classified by each stakeholder, both the fishermen ($M =$

1380 4.0) and supplier and retailers ($M = 4.5$) have good feedback in system integration,
1381 while the consumers($M = 3.67$) have an average rating. The frequency of consumer
1382 use among stakeholders, when taken as a whole, have good feedback ($M = 4.03$).
1383 When analyzed individually, both the fishermen ($M = 4.0$) and consumers ($M =$
1384 4.33) have a good rating, while an average rating for the supplier and retailers (M
1385 = 3.75).

1386 4.7.3 Results and Analysis

1387 For functionality, fishermen rated asset tracking positively but identified chal-
1388 lenges in real-time updates and smart contract execution. Suppliers and retail-
1389 ers similarly found strengths in verification and real-time updates, although as-
1390 set tracking averaged slightly lower. Consumers consistently rated functionality
1391 highly, particularly appreciating the system's ability to support smart contracts.

1392 Regarding end-user needs, fishermen provided the lowest ratings, highlighting
1393 difficulties with seamless interaction, considering the digital barrier that they ex-
1394 perience while interacting with the app. Suppliers, retailers, and consumers gave
1395 higher scores, suggesting that while transparency was generally achieved, the sys-
1396 tem's ease of interaction required further improvement for all users.

1397 In terms of performance, fishermen and suppliers reported average transaction
1398 efficiency but noted concerns regarding data integrity and security. Consumers,
1399 on the other hand, expressed confidence in both areas.

1400 For usability, consumers provided the highest ratings, emphasizing the intuitive
1401 design and accessibility of the interface. Fishermen and suppliers also rated us-

¹⁴⁰² ability positively but suggested improvements, such as better visual appeal and
¹⁴⁰³ language localization. Feedbacks suggested incorporating the Karay-a language
¹⁴⁰⁴ since most of the potential users uses that language in their everyday lives. An-
¹⁴⁰⁵ other suggestion was to use capitalization (UI/UX) for the name of the tuna to
¹⁴⁰⁶ give more emphasis to it.

¹⁴⁰⁷ Ease of use was generally rated positively across all groups. However, feedback
¹⁴⁰⁸ highlighted the need for additional user guidance features, including clearer button
¹⁴⁰⁹ descriptions and localized instructions for broader accessibility.

¹⁴¹⁰ Finally, feasibility was strongly affirmed by all groups. Stakeholders believed the
¹⁴¹¹ system could be effectively integrated into the existing tuna supply chain and
¹⁴¹² accessed by consumers as a means to monitor tuna products.

¹⁴¹³ Chapter 5

¹⁴¹⁴ Conclusion

¹⁴¹⁵ 5.1 Overview

¹⁴¹⁶ This chapter presents the key findings and conclusion of the study. It also discusses
¹⁴¹⁷ how the system addresses the challenges of traceability within the tuna supply
¹⁴¹⁸ chain. This chapter also provides recommendations in enhancing the system's
¹⁴¹⁹ functionality and usability, ensuring that the SeaXChange app continues to meet
¹⁴²⁰ evolving needs of its users.

¹⁴²¹ 5.2 Conclusion

¹⁴²² This study aimed to develop and evaluate SeaXChange, which is a blockchain-
¹⁴²³ driven app designed to enhance transparency, traceability and accountability
¹⁴²⁴ within the tuna supply chain. Through the adaption of Scrum, the team was

¹⁴²⁵ able to develop a functional prototype that was based on iterative development
¹⁴²⁶ to achieve goals.

¹⁴²⁷ The results from the gathered data suggests that the app has effectively addressed
¹⁴²⁸ key challenges in traceability and accountability, especially among suppliers and
¹⁴²⁹ consumers. The stakeholders consistently rated the system as good. However,
¹⁴³⁰ some areas need improvement, especially in ensuring seamless interaction and
¹⁴³¹ data security for fishermen.

¹⁴³² Overall, SeaXChange demonstrates strong potential as a technological solution for
¹⁴³³ promoting transparency, combating illegal, unreported, and unregulated (IUU)
¹⁴³⁴ fishing, and empowering stakeholders across the tuna supply chain.

¹⁴³⁵ 5.3 Recommendations

¹⁴³⁶ After analyzing and interpreting the gathered data, the researchers had identi-
¹⁴³⁷ fied some improvements and recommendations for the further development and
¹⁴³⁸ implementation of the SeaXChange app.

¹⁴³⁹ 1. Incorporation of Local Language

¹⁴⁴⁰ Since most of the target users are within Miagao, the system could provide
¹⁴⁴¹ multi-language support, including the Karay-a language. This will improve
¹⁴⁴² guidance through clearer button descriptions.

¹⁴⁴³ 2. Utilization of IoT

¹⁴⁴⁴ The system could use Internet of Things (IoT) in verifying the fisherman's lo-
¹⁴⁴⁵ cation. This will add more accountability in tracing the fisherman's current

1446 location. Suitable IoT devices include temperature sensors (like DS18B20,
1447 DS1922L) to monitor the fish's temperature during transportation and stor-
1448 age and GPS chips to track the location of fishing boats and transport
1449 vehicles.

1450 **3. Inclusion of User Manual**

1451 To further enhance the experience of its users, the researcher could provide
1452 printed or digital copies on the system's functionalities. This will help users
1453 navigate through the system without being lost.

1454 **5.4 Summary**

1455 In conclusion, the development of the SeaXChange app highlights the critical role
1456 of emerging technologies in providing solution regarding the traceability, trans-
1457 parency and accountability within the tuna supply chain. While the system has
1458 demonstrated strong potential, continuous improvements are still needed to en-
1459 sure its effectiveness. Moreover, further development and usability enhancements
1460 will be essential in attaining SeaXChange's goal of creating a more traceable,
1461 transparent and accountable tuna industry.

¹⁹³⁷ A.1 Hyperledger Fabric Deployment Instructions

¹⁹³⁸ The following steps outline the process for deploying and testing the fish supply
¹⁹³⁹ chain smart contract on Hyperledger Fabric using Google Cloud Platform.

¹⁹⁴⁰ A.1.1 Environment Setup

¹⁹⁴¹ 1. Open GCP and access the VM instance:

- ¹⁹⁴² • Navigate to Console → Compute Engine → VM instances → start →
- ¹⁹⁴³ click SSH
- ¹⁹⁴⁴ • Alternatively: Virtual Machine → start → instance → SSH

¹⁹⁴⁵ 2. Connect to the instance:

Listing A.9: Connect to GCP VM via `gcloud`

```

1947      gcloud compute ssh instance
1948          -20250322-102900 --zone=us-central1-c
1949

```

1950 3. Navigate to the test network directory:

1951 Listing A.10: Navigate to Compose Directory

```

1952      cd ~/fabric-samples/test-network/
1953
1954      compose

```

1955 A.1.2 Network Startup and Smart Contract Deployment

1956 1. Start the Hyperledger Fabric network:

1957 Listing A.11: Start Fabric Network

```

1958      sudo docker-compose -f
1959          compose-test-net.yaml
1960
1961      start

```

1962 • Deploy the chaincode:

1963 Listing A.12: Deploy Chaincode

```

1964      cd ../
1965
1966      ./network.sh deployCC -ccn
1967          basic -ccp ../asset-
1968              transfer-basic/chaincode-
1969                  go -ccl go

```

1970 • Set environment path variables:

Listing A.13: Path Environment Variables

```

1971
1972           export PATH=${PWD}/../bin:
1973           $PATH
1974
1975           export FABRIC_CFG_PATH=${PWD}
1976           /../config/

```

- 1977 • Configure organization environment variables:

Listing A.14: Org1 Environment Configuration

```

1978
1979     # Environment variables for
1980     Org1
1981
1982     export CORE_PEER_TLS_ENABLED
1983             =true
1984
1985     export CORE_PEER_LOCALMSPID=
1986             "Org1MSP"
1987
1988     export CORE_PEER_TLS_ROOTCERT_FILE
1989             =${PWD}/organizations/
1990             peerOrganizations/org1.
1991             example.com/peers/peer0.
1992             org1.example.com/tls/ca.
1993             crt
1994
1995     export CORE_PEER_MSPCONFIGPATH=$
1996             ${PWD}/organizations/
1997             peerOrganizations/org1.

```

1998	msp
1999	export CORE_PEER_ADDRESS=
2000	localhost:7051
2001	

2002 A.1.3 Testing the Smart Contract

2003 1. Initialize the ledger:

Listing A.15: Invoke InitLedger

2004	peer chaincode invoke -o localhost:7050
2005	--ordererTLSHostnameOverride orderer
2006	.example.com --tls --cafile "\${PWD}/
2007	organizations/ordererOrganizations/
2008	example.com/orderers/orderer.example.
2009	com/msp/tlscacerts/tlsca.example.com-
2010	cert.pem" -C mychannel -n basic --
2011	peerAddresses localhost:7051 --
2012	tlsRootCertFiles "\${PWD}/
2013	organizations/peerOrganizations/org1.
2014	example.com/peers/peer0.org1.example.
2015	com/tls/ca.crt" --peerAddresses
2016	localhost:9051 --tlsRootCertFiles "\${
2017	PWD}/organizations/peerOrganizations/
2018	org2.example.com/peers/peer0.org2.
2019	example.com/tls/ca.crt" -c '{"
2020	function":"InitLedger","Args":[]}]'
2021	
2022	

2023 2. Query assets:

2024 Listing A.16: Query Fish Asset

```
2025                    # Query a specific fish asset  
2026                    peer chaincode query -C mychannel -n  
2027                    basic -c '{"Args": ["ReadAsset", "tuna1  
2028                    "]}]'  
2029  
2030                    # Query all assets in the ledger  
2031                    peer chaincode query -C mychannel -n  
2032                    basic -c '{"Args": ["GetAllAssets"]}'  
2033
```

2034 3. Shut down the network:

2035 Listing A.17: Stop Fabric Network

```
2036                    sudo docker-compose -f compose-test-net  
2037                    .yaml stop  
2038
```

2039 **A.1.4 Important Notes**

- 2040 • Ensure proper network connectivity when working with Google Cloud Platform.
- 2041
- 2042 • The environment variables must be set correctly for the organization context.
- 2043 • TLS certificates are required for secure communication between nodes.
- 2044 • The commands assume the blockchain network is already provisioned on GCP.
- 2045

Division of Physical Science and Mathematics
College of Arts and Sciences
University of the Philippines Visayas
Miag-ao, Iloilo

Dear Ma'am/Sir,

Maayong adlaw! We are a group of Computer Science students from the University of the Philippines currently working on our project entitled "SeaXChange: A Blockchain-Driven App for Tuna Supply Chain Management". As part of the development and testing phase, we would like to interview selected fishermen, suppliers, retailers and consumers here in Barangay Mat-Y to gather feedback and evaluate the usability and practicality of our application. The interview will be conducted from April 21-25, 2025.

The goal of our system is to help track tuna products from the ocean to the consumers and to improve the traceability of the tuna supply chain. We believe that the insights from the fishermen, suppliers, retailers and consumers will be extremely valuable in making it more effective and user-friendly.

We respectfully request your permission to lend us your precious time to participate in our short interviews or discussions. Rest assured that all information collected will remain confidential and will be used for academic and research purposes only.

We hope for your favorable response. Thank you for your time and support!

Sincerely,
The student researchers
